As far as I know they do not make contacts on HF. Only 2 meters.

Considering that, by definition, HF works by bouncing signals off the ionosphere, it would be rather difficult for te shuttle, or any spacecraft, to have much success trying to communicate with ground stations via HF. 10 meters is the practical limit for space communications.

All amateur operations from the shuttle are on the 2 meter band. It's been reported that Mir will be upgrading its 2 meter radio to a 2 meter / 70 cm unit.

NASA audio from shuttle mission is retransmitted on H-F by the Goddard Spaceflight Center's amateur radio club WA3NAN. The planned HF operating frequencies are:
3.860 MHz 7.185 MHz
14.295 21.395 28.650

I don't know of any amateur tracking system but in the sixties I worked at a
NASA STADAN station (Satellite Tracking and Data Acquisition Network) at
Winkfield near Windsor UK.

One of the systems used there on 136 MHz used an array of Yagis.(3x3 I think)
It measured the phase between the outer most Yagis and fed the errors to the
control system and hence to the hydraulic pumps.

You had to steer the antenna to the predicted position and once you had AOS
postion it using AGC volts, then switch to auto.

BTW are there any readers out there who used to work in the STADAN or
Minitrack networks?

Nowadays I uplink to satellites on 14 GHz for SNG. (Satellite News Gathering)

Look in AMSAT's fileserver, ftp.amsat.org, under "mods" and
you'll find directions for modifying FT-736R, TS-790, and Icom
radios, as well as others for 9600 baud.

The ouput level of the DSP2232 can be increased by clipping one
side of a 5 to 1 power divider resistor for each of the two
ports. I can't remember the resistor numbers off the top of my
head, but you may find this mod in the fileserver as well.

good luck de wb4qkt/stacey

>I will be venturing into the HF world soon, and I have heard that the
>shuttle sometimes makes contacts on HF. If this is true, does anyone
>know the frequencies they typically use?

There is definitely no amateur HF on the shuttle. All there contacts are 2 meter FM.

The shuttle downlink frequency (your listening frequency) is 145.550 MHz. There are several uplink frequencies, but the only one they use is 144.95 MHz. The only time a reliable contact can be made is when the shuttle is orientated with it's top side towards earth.

Note that MIR uses 145.550 MHz simplex. Therefore STS-71 (the docking mission with MIR) will use a downlink of 145.840 MHz and uplinks of 144.45 or 144.47 MHz.

good luck

Source record: 24940

Jean-Francois,

I have a FT-736 which I use for both 9600 and 1200 baud. The best solution I have found is to use the original data port for 1200 and the G3RUH mod port for 9600. I use a 3.5mm stereo jack for the 9600 baud port also just like the 1200. This way I can easily move the cable to the proper port for the operation intended. Also you must remove the plug from the radio or the TNC to use the radio in FM voice. This could be made simpler with a switching arrangement.

Also be warned the Yaesu pinout for the data port is incorrect. The tip is transmit audio and the ring receive audio the sleeve ground. I believe it is backward in most manuals. I don't think the Yaesu drives the DSP-2232 hard enough at 9600 so you may have to change some resistors.

Sounds fine, but I was hoping to do it with no ancilliary antennas.

Source record: 24944

Hi All,

I am considering setting up a redistribution list to allow Sysops of Packet Radio (and all digital MBO's) to receive the "Jonathans Space Report" in a packet ready format.

I have been in touch with Jonathan McDowell, the author of the document have his permission to do so. My reasons for wanting to set up the distribution list are to assist sysops who don't have newsgroup access, and secondly, to introduce a BID to try and minimise the amount of duplication of this report that is taking place. I currently have 5 copies of one edition on my BBS, all obviously from well meaning users (and sysops?) each with a different BID.

My proposed format for the address and title is:

SB SPACE @ WW $JSR(xxx)
Jonathans Space Report #(xxx)

where (xxx) is the bulletin number provided by the author.

Please e-mail subscriptions to:
h14763@ngynfs02.eskom.co.za
Subject: SUBSCRIBE JSR-LIST

You will be added to list against the <return-to field> address of your e-mail note.

Best Regards

What was the minimum antennae separation required to ensure a
measurable phase difference between signals at that frequency.
How was it calculated? Is there any reason why a similar system
could not be employed in amateur areas other than groundspace
required and potential cost?

Regards,
Julian.

From ARRL Headquarters
Newington, CT May 26, 1995
To all radio amateurs

SB SPACE ARL ARLS006
ARLS006 SAREX To Fly In June

The Shuttle Amateur Radio EXperiment, or SAREX, will be carried on the 100th US human space mission when the Space Shuttle Discovery launches on June 8, 1995 at 1326 UTC. The mission is designated STS-70, and the crew includes one Amateur Radio-licensed astronaut, Mission Specialist Donald A. Thomas, KC5FVF. The crew has scheduled voice contacts with 8 school groups in the US and one in Argentina. Landing is targeted for June 16 at 1136 UTC at the Kennedy Space Center in Florida.

On this mission, the SAREX hardware will be flown in configuration C which includes 2 meter FM voice and packet. Amateurs should use the usual frequency set to make random SAREX contacts. The astronauts will operate split, transmitting and receiving on separate frequencies. Please do not transmit on the shuttle's downlink frequency. The downlink is your receiving frequency. The uplink is your transmitting frequency. The FM voice downlink is 145.55 MHz. The FM voice uplinks are 144.91, 144.93, 144.95, 144.97 and 144.99 MHz. The crew will not favor any of the uplink frequencies, so your ability to communicate with SAREX will be the ''luck of the draw.'' To avoid causing interference to other stations, transmit only when the shuttle is within range and when the SAREX station is on the air. The crew will use KC5FVF as the primary voice call sign. On packet, use W5RRR-1 to log a contact on the SAREX ROBOT.

The following Keplerian tracking elements were provided by Gil Carman, WA5NOM, of the NASA Johnson Space Center:

STS-70
1 99970U 95160.80510237 .00017899 00000-0 55675-4 0 123

Eccentricity: .0016417 Prelaunch element set JSC-012
Arg of perigee: 154.9557 deg Launch: 08-Jun-95 13:26:00 UTC
Mean anomaly: 205.1895 deg
Mean motion: 15.89705110 rev/day Gil Carman
Decay rate: 1.7899e-04 rev/day sq NASA Johnson Space Center
Epoch rev: 21
Checksum: 316

Send reports and QSLs to ARRL EAD, STS-70, 225 Main Street, Newington CT 06111-1494 USA. Include the mission number, date, time in UTC, frequency and mode in your report. You must also include a self-addressed stamped business-sized envelope if you wish to receive a card. The Sterling Park Amateur Radio Club in Sterling, VA has generously volunteered to manage the cards for this mission.

The flight will highlight the deployment of a sixth Tracking and Data Relay Satellite. Once deployed, an engine on the satellite will boost it into a geostationary orbit. The TDRS System provides NASA with communication and tracking capability to meet its mission support requirements.

SAREX will also be carried on mission STS-71, which is scheduled for no earlier than June 23. During that mission, the Shuttle Atlantis will rendezvous and, for the first time, dock with the Russian Space Station Mir. The shuttle will carry two new Mir crew members (Mir 19) to the station, and return to Earth with the three Mir 18 crew members, including US astronaut Norm Thagard.

For more information on SAREX, contact the ARRL Educational Activities Department.

I draped a long length of coax from the tail end of the antenna back to the mast. Allow for max rotation at 0 deg elevation, this is the longest length you need.
The advantage to this method is the feedline has the least effect on the antenna pattern. However, it changes the balance point of the antenna. I use a barely adequate $70 rotor that must be statically balanced or else it stalls. So I spent a lot of time up there tweaking the system.
Running the coax back to the cross-boom and then down the mast, looks neater but takes the same amount of line. It also affects the static balance.

A good place to start learning is the "Satellite Experimenter's Handbook" published by the ARRL. The book is getting a bit old, but the background info is useful.
MIR is only 300 miles up, so it's signal is louder than most digital sats. I doubt the eggbeater will be adequate, unless simply accessing the sat is OK and actually downloading files is not wanted. Some experianced eggbeater user can enlighten us here.
Rotatable beams maximize the throughput by maximizing signal strength. Low signals cause retries and most files need multiple passes to complete anyway.
DSP, if you can afford it and build it, is the safest investment. The 1200 baud PSK birds are dying off. 9600 baud is ok for now, but future birds will have even higher rates.
Check out the Amsat Web site, if you have Web access, or FTP some of the info files.

ftp.amsat.org

Correct me if this is the wrong address.

The recent QST had an article about Internet/Packet gateways. The key is finding a gateway and wrapping your message properly. Check the June '95 QST.

>73 de N9AVG

I also used 6 feet spread. Later I changed to 10 feet. Both booms were 1-1/4
inch EMT conduit. With the X configuration it minimizes pattern distortion.
A paper was presented at an AMSAT conference regarding this matter. The
gist of it is that it is not a big deal, using the X, even if the boom is metal. The
spacing is though. Six feet is about one wavelength for 2 meters, closer and the
70cm antenna gets overloaded.
I used a tip from the ARRL handbook to reduce the 3rd harmonic of 145.8...
getting into the 70cm system. Take a 1/4 wave stub (at 435.???), short the far
end, and 'T' this into the 2 meter feedline. This is a cheap low-pass filter and costs
just a little signal strength. The higher quality coax, the better the filtering. Same
for the connectors used.
The exact length will vary by the velocity factor of your coax, and at 435, a
1/4 can move it alot. Be prepared to experiment. A free bonus of this method is
coax is now DC grounded for static bleed-off.

" Considering that, by definition, HF works by bouncing signals off the
" ionosphere, it would be rather difficult for te shuttle, or any
" spacecraft, to have much success trying to communicate with ground
" stations via HF. 10 meters is the practical limit for space
"

No, not true. There is no reason why HF should not be used provide
the path is not precluded by the critical angle of reflection/refraction
defined by the ionospheric situation current at the time of transmission.

Practically, though, this is unpredictable in detail just as terestrial HF
propagation is. That is only why VHF is preferred. Don't forget the first
SPUTNIKS used 20 MHz +/- 5 KHz (Mc/s in those days!) I still have a few old
tapes of those signals. Some wild signal level changes took place as the craft
passed through the critical angle - a bit before going below the geographic
horizon.

Even I was still at school then ...

Yes I mean phase. If the array is pointing directly at the satellite the
received signal at each of the outer Yagis will be in phase. If the satellite
is slightly to the left of the array then the signal in the left Yagi will be
leading in phase wrt the right Yagi and vice versa.

Hi all,

I don't know much about operation through OSCAR satellites and would like to get started with it and aim toward a 23cm up and 70 cm downlink (portable station) that I could take on backpacking trips.

In the literature department I came across the Satellite Experimenter's Handbook which seems to still be in the first edition (any info in it on the new Microsats?) or does anyone know if there has been a new edition that came out since the first one in 1990?

I also came across the Hamsat Handbook.

Does anyone consider one of the handbooks inferior/more outdated than the other?

Thanks for your input.

> (based on the known lobe shape of a the particular rx antenna being used).

The scheme of conical scanning you describe was widely used in radar systems in the 1940s and 1950s (and was called conical scanning). You can find detailed descriptions of it in old radar books. It should work well if the satellite emits a continuous (constant power) beacon signal.

The other scheme mentioned is phase-comparison monopulse. This is a tracking technique used in radar from the 1960s to the present, and detailed technical descriptions can be found in radar textbooks. Since it relies on phase information it is relatively immune to amplitude variations on the signal being tracked. This technique usually requires the antenna to be divided into subapertures whose signals are processed through separate receiver channels. This gets to be expensive, so is less suitable for amateur projects.

From what I can see, looking at my list from AMSAT, there is a book called "How to use amateur radio satellites" from AMSAT. It's only $5.00 US, so it won't kill the budget. The address is AMSAT, 850 Slingo Ave., Silver Spring, MD 20910. Or if you want to use VISA/MC, call 301-589-6062. I hope that helps!!

1160. Traksat?

Newsgroup: rec.radio.amateur.space
Date: 1995-05-30 00:00:00 UTC
From: David Johnson <djohnson@acpub.duke.edu>
Message-ID: <Pine.ULT.3.91.950530134209.10013B-100000@bio7.acpub.duke.edu>
Source record: 24866

Hello enthusiasts-of-the-sats:

First, thanks to all who replied to my earlier, basic query from a newbie. I have started to follow some of the good advice on getting started. I have obtained Traksat, and am trying to figure out how to use it with my own keps input file (like the ARRL bulletin with the keps). Is anyone adept at this who can provide directions for a simpleton? I hope to get on the 10m/15m bird soon. Thanks, and best wishes to all the bird-watchers and bird-talkers!

Dave

Check out the AMSAT www site for many digitized photos of the Phase 3-D
spacecraft under construction by Dick Jansson, WD4FAB and myself.

I also sent a couple of digitized images of Ron Parise, WA4SIR, from his
recent shuttle mission and they may be available for download.

I hope to get a bunch more up there some time soon when I get the chance
to digitize them, along with some photos of the earlier satellites.

I have ++hundreds++ of pictures recieved from NOAA 9, 10, 11, 12, 13 (few), 14 - these craft being of US origin. Also in my archive are many METEOR 2/21 3/3, 3/4, 3/5 and a very few OKEAN 4 pictures - this group is of Russian (Soviet) origin. My pictures are *of course* as received from craft over or near the UK, generally extending from the north Sahara to close to the North Pole and rather less distance East and West.

These are weather, polar orbiting satellites. They transmit data of many kinds in an internationally agreed format known as APT (Automatic Picture Transmission) - broadly an analogue form of the shore-to-ship and aircraft fax chart system. The data is open to all who wish to use it, again by international agreement.

As for public sources - no idea, I get my own!

Regards to all,
--

I use TrakSat 2.80 on a pokey 286, and I have found it to be a little quirky.
One thing I have found is that if I download two-line keps from e-mail, I
have to use a DOS editing program (the EDIT for DOS 6 will work with version
3.3, and is good... hint, hint!) and remove the e-mail headers. A better
solution is to ftp to archive.afit.af.mil in the /pub/space directory and
get the *.tle files. (ie, amateur.tle, mir.tle, etc.) They are updated
frequently.

Good luck with the birds!

=========

MONDAY MAY 29, 1995

SpaceNews originates at KD2BD in Wall Township, New Jersey, USA. It is published every week and is made available for unlimited free distribution.

* PANSAT NEWS *
===============
The Petite Amateur Navy Satellite (PANSAT) is a small, spread-spectrum communication satellite developed by the Naval Postgraduate School (NPS) as an educational project for officer students. PANSAT will be a tumbling spacecraft with a weight of 150 pounds to be completed in 1996. PANSAT will most likely be launched from the Space Shuttle by means of the HitchHiker program. The launch will place PANSAT in a Low Earth Orbit (LEO) with an inclination of at least 28 degrees. The spacecraft will supply direct-sequence, spread-spectrum modulation with an operating center frequency of 436.5 MHz, a bit rate of 9600 bits per second and 4 MB of message storage. Amateur radio ground stations will be able to utilize PANSAT for store-and-forward communication.

Through use by the amateur radio community PANSAT will supply a means to demonstrate spread-spectrum communications. In addition, PANSAT provides many potential applications for low-cost communications. The low probability-of-intercept would be an important feature for the military in downed-pilot-rescues. The pilot could obtain his/her location through a GPS system and uplink the information to the orbiting satellite at low risk. Examples of civilian uses include emergency rescue and communication to remote areas.

To prepare the spacecraft for flight it will undergo functional and environmental testing at the system and subsystem level. The environmental testing includes thermal vacuum, random vibration, and electromagnetic interference and compatibility (EMI/EMC) testing. All testing will be conducted using NPS space test facilities.

A modified amateur satellite ground station is needed to communicate with PANSAT. The NPS ground station utilizes off-the-shelf software, is microcomputer controlled, and is equipped with a spread-spectrum modem.

The NPS ground station is similar to a typical amateur radio user station, except it has spacecraft command capability. The NPS ground station is also utilized as a classroom instructional laboratory.

[Info via the Naval Postgraduate School]

* MIR SCHOOL CONTACT *
======================
Dave, N1PPP reports that the Russian space station Mir made a scheduled radio contact with Chris Edscorn at Crotched Mountain school in New Hampshire over the past week. Chris teaches a special education communications class, and since there is no third party agreement with Russia, asked questions of Dr. Norm Thaggard for the class. The contact lasted about six minutes. Dr. Thaggard was very busy with a communications satellite and wasn't sure he would be able to make the contact, but managed to take a few moments to make the contact.

* WO-18 CRASH *
===============
Bob Argyle, KB7KCL, at Weber State University has reported that sometime between 17-May-95 21:30 UTC and 18-May-95 19:12 UTC, Webersat/OSCAR-18 experienced a software crash. The transmitter has been turned back on and is sending MBL telemetry. After determining the cause of the crash, the spacecraft controllers will reload the satellite with its software, adding a few new features.

The following MBL frames were received from WO-18 by KD2BD in New Jersey on Saturday 27-May-95:

WEBER-1>TIME-1 <UI>:
PHT: uptime is 003/12:22:01. Time is Sat May 27 18:11:29 1995

Webersat command team

* LOST SATELLITE LOGS *
=======================
Benoit, VE2VB, of St-Felix de Valois Quebec (Grid FN36ic) has reported that he lost a computer file containing logs of some of his recent satellite contacts. He made about 30 contacts on AO-10 and AO-13 in the month of April, and asks anyone who may have worked him during this period to contact him so he can build his log up again and issue QSL cards to those who need them.

Benoit can be reached on packet radio at: VE2VB@VE2CLJ.PQ.CAN.NA, or via
the Internet at: ve2vb@mtlgw.ampr.org. Benoit's postal address may be
found in any Callbook from 1987 to the present.

* SATELLITE NEWS *
==================
Benoit, VE2VB, reports that is in Mode JA and FO-20 is working great.
On 25-May-95 he reported very strong downlink signals and worked stations
in Europe and in the USA while the satellite was along the U.S. east coast.
He also reports receiving very strong downlink signals from AO-10 on
24-May-95 using a 22 element yagi and no preamp.

1169. Re: Reply: E-mail to Satellite

Newsgroup: rec.radio.amateur.space
Date: 1995-05-31 00:00:00 UTC
From: mntbobv@aol.com
Message-ID: <3qh4lg$fne@newsbf02.news.aol.com>
Source record: 24875

The following info may be a way for you to E-Mail to Satellite:

Internet/Packet Radio BBS Gateway

Are there any gateways for mail or news between Internet and Amateur
Packet
radio?

Jim Durham, W2XO, maintains a gateway between Internet and the Packet
radio
BBS system.

To mail from Internet to Packet:
1. Mail to: "bbs@w2xo.pgh.pa.us"
2. where bbs is AA1AA%W1ABC.MN.USA.NOAM
NOTE: Because of FCC regulations, Jim must hand filter each message
sent
FROM Internet TO the Amateur Packet Radio BBS system. Messages should be
of
minimal length and appropriate content. Read Section 1.9 (Do's and
Don'ts:
Rules and Regulations) regarding appropriate usage of packet radio for
more
information. Always include the routing hints with the BBS callsign.

To mail from Packet to Internet:
1. The amateur radio operator must have his callsign registered in the
gateway alias list. If you want to mail from packet to a specific amateur
on
Internet, send mail to 'durham@w2xo.pgh.pa.us' (Internet) or 'W2XO @
W2XO.#SWPA.PA.USA.NAOM' (Packet BBS mail) with his/her amateur callsign
and
their Internet address.
2. Once the above is accomplished, packet BBS mail should be sent to
'CALL
@ W2XO.#WPA.PA.USA.NAOM'. The mail will automatically be forwarded to the
Internet address of the amateur with the 'CALL' callsign.

Jim Durham's Internet address is 'durham@w2xo.pgh.pa.us'.

LAN Gateways (Packet wormholes via Internet)

Currently a group of amateurs are experimenting with connecting packet
LANs
together via Internet IP inside IP Encapsulation. Some of the gateways
only
accept TCP/IP packets, others AX.25 packets. These gateways uses the

Internet as a transport medium, thus it is impossible to access the packet radio network from Internet. For more information, join the Gateways mailing
list by sending mail to "gateways-request@uhm.ampr.org".

>but I never heard it. Can you help me?
>
Sorry to bring bad news, but unless AO-27 changes management the schedule
of operation is erratic at best. It was turned on for the weekends (daylight hours) before
the present management took over, but now is on at random.

AO-21 was on continuously until its' recent demise due to the phase out
of the mother satellite by Russian controllers.

There are no other FM birds up and unless there are some plans in the
works, there will be none in the next few years. P3D does not have any
provision for FM (although with some careful planning it would have been
possible.) Other planned satellites are all digital store and forward or
special interest experimental (semi-commercial.)

1176. Two-Line Orbital Element Set Format

Newsgroup: rec.radio.amateur.space
Date: 1995-05-31 00:00:00 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.801962709@dolphin>
Source record: 24882

As a service to the satellite user community, the following description of the NORAD two-line orbital element set format is uploaded to sci.space.news and rec.radio.amateur.space on a monthly basis. The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (334) 409-9280, and are updated several times weekly. Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at speeds up to 14,400 bps using 8 data bits, 1 stop bit, no parity. In addition, element sets (updated weekly) and some documentation and software are also available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

==========

Data for each satellite consists of three lines in the following format:

```
AAAAAAAAAAAAAAAAAAAAA
1 NNNNNU NNNNNAAA NNNNN.NNNNNNNN +.NNNNNNNN +NNNNN-N +NNNNN-N N NNNNN
2 NNNNN NNN.NNNN NNN.NNNN NNNNNNN NNN.NNNN NNN.NNNN NN.NNNNNNNNNNNNN
```

Line 0 is a twenty-two-character name (this change is being made to be consistent with the name length in the NORAD SATCAT).

Lines 1 and 2 are the standard Two-Line Orbital Element Set Format identical to that used by NORAD and NASA. The format description is:

```
Line 1
Column Description
01-01 Line Number of Element Data
03-07 Satellite Number
10-11 International Designator (Last two digits of launch year)
12-14 International Designator (Launch number of the year)
15-17 International Designator (Piece of launch)
19-20 Epoch Year (Last two digits of year)
21-32 Epoch (Julian Day and fractional portion of the day)
34-43 First Time Derivative of the Mean Motion
or Ballistic Coefficient (Depending on ephemeris type)
45-52 Second Time Derivative of Mean Motion (decimal point assumed;
blank if N/A)
54-61 BSTAR drag term if GP4 general perturbation theory was used.
Otherwise, radiation pressure coefficient. (Decimal point assumed)
63-63 Ephemeris type
65-68 Element number
69-69 Check Sum (Modulo 10)
(Letters, blanks, periods, plus signs = 0; minus signs = 1)
```

Line 2
Column Description
01-01 Line Number of Element Data
03-07 Satellite Number
09-16 Inclination [Degrees]
18-25 Right Ascension of the Ascending Node [Degrees]
27-33 Eccentricity (decimal point assumed)
35-42 Argument of Perigee [Degrees]
44-51 Mean Anomaly [Degrees]
53-63 Mean Motion [Revs per day]
64-68 Revolution number at epoch [Revs]
69-69 Check Sum (Modulo 10)

All other columns are blank or fixed.

Example:

NOAA 6
1 11416U 86 50.28438588 0.00000140 67960-4 0 5293
2 11416 98.5105 69.3305 0012788 63.2828 296.9658 14.24899292346978

Within the last year or so, Zack Lau, KH6CP/1 (zlau@arrl.org) had an article in QST about portable QRP Mode S. I don't know what month. Drop him a line and ask.

73,

David Reinhart

Hello up there....

i got sattrak.tar.z from some FTP site <oakland or amsat>, and i'm trying to
get it to work on pc ver. of Linux......it might if a can help. But does it?

also, any ftp sites for actual PC LINUX/Xwindoze sat. traking progs?

thanks
DavID

I have just started using it. Very nice but it acts like a paint program eraser under certain conditions. Had to change to a different mouse to make that problem go away. Also has two major drawbacks: cannot be operated by the keyboard, does'nt provide a hook to a callsign database. I suspect the callsign thing will be taken care of in future releases. I have used most of the major traking programs and in all honesty it is the best one I have used. They also need to get it into windows as well (not as a DOS task !). Very nice program !!!!!!!!!!!!!

Dave

1180. Icom GPS or Others??

Newsgroup: rec.radio.amateur.space
Date: 1995-05-31 00:00:00 UTC
From: sem2r@galen.med.Virginia.EDU
Message-ID: <D9GLn1.C0F@murdoch.acc.Virginia.EDU>
Source record: 24886

How does Icom's GPS receiver (GP-22) compare to some of the others on the market? The price is now down to about $430.00. What functions does it lack when compared to the higher priced models? Same sensitivity?? Calculate 3-D coordinates? Give grid squares, etc??

Thanks for the help!! Please E-mail direct to: sem2r@galen.med.virginia.edu

I am using nova what are some of your questions ? I have a problem with the program using a bus mouse. It makes the screen go blank in some areas. It doesn't do it with all bus mouses. I am using a COMM-5 bus mouse, but a microsoft mouse works ok I guess. The program really wasn't ready for distribution I don't think. The author wanted to get some sales at Dayton. I like the program. I just hope they fix the bugs.....

1183. Lat/Long to Grid Square Software

Newsgroup: rec.radio.amateur.space
Date: 1995-06-01 00:00:00 UTC
From: sem2r@galen.med.Virginia.EDU
Message-ID: <D9IB90.1uM@murdoch.acc.Virginia.EDU>

I know there's software to convert lat/long to maidenhead grid
squares down to the 2 letter suffix, but I don't know where I
saw it.

Anyone know an anonymous ftp site where I can get it?

E-mail direct to: sem2r@galen.med.virginia.edu

I'll post the "best" site answer.

thanks for your help!!!

Good point! When I first saw those responses a little alarm bell started ringing in my head. Besides SPUTNICK, there was also the first Chinese sattelite which I remember listening to on my Zenith Transoceanic shortwave! I was only a kid, but I remember it like it was last week because it was such a thrill

1185. Two-Line Orbital Element Sets (TLE613)

Newsgroup: rec.radio.amateur.space
Date: 1995-06-01 00:00:00 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.801968335@dolphin>
Source record: 24891

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (334) 409-9280, and are updated daily (when possible). Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at speeds up to 14,400 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily) and some documentation and software are available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space.news and rec.radio.amateur.space. This week's elements are provided below.

```

Probably your best bet is going to be on the dsp-93 listserv.

All the technical support fot eh dsp-93 is there, plus Roy Welch (who supports a lot of WISP related stuff) is active in the development group.

send e-mail to

listserv@tapr.org

in the message body say:

subscribe dsp-93 First_Name Last_Name

That should work.

Cheers - Greg, WD5IVD

In my opinion the one to get is the GARMIM 45 at the low end.
West Marine in Seattle and others sell it for $299. It is the
latest generation whiuch beats the ICOM in several areas.

Check out the news group:sci.geo.satellite-nav

They have the answer!

I've observed significant changes in signal amplitude due to atmospheric
fading and changes in the satellite's attitude relative to the ground
station for all the satellite's I've listened to, *especially* the
LEO satellites where automatic tracking is most helpful.

My control theory books are all at home, so this is from memory....
If the antenna can be slewed fast enough relative to the fading, you
could probably come up with a smoothing algorithm that would converge
on the target satellite. If the fading is faster than the antenna
motion, I'm not sure tracking by amplitude would work.

>The other scheme mentioned is phase-comparison monopulse. This is a
>tracking technique used in radar from the 1960s to the present, and
>detailed technical descriptions can be found in radar textbooks. Since it
>relies on phase information it is relatively immune to amplitude
>variations on the signal being tracked.

The first AO-10 ground stations used single-polarization yagis mounted
on either end of the cross boom. The antennas were canted 90 degrees
to each other and phased to produce circular polarization. The Satellite
Experimenter's Handbook describes this arrangement, and also points out
problems encountered when the antenna system pointed slightly away from
the satellite - essentially, demonstrating the phase difference of
arrival effects.

>This technique usually requires
>the antenna to be divided into subapertures whose signals are processed
>through separate receiver channels. This gets to be expensive, so is >less suitable for
amateur projects.

There have been a number of PDOA/TDOA tracking boxes developed by the
hidden transmitter hunting (fox hunt/t-hunt) community. You could
probably connect one to an antenna array where the two antenna feedlines

join and see if it works. As these units are designed for FM signals, they may not work at all on the CW/SSB transponders, but should work great on FM downlinks - MIR, SAREX, AO-27, and the 9600 bps packet satellites.

A control system can take advantage of the known behavior of the satellite. Once a "lock" is achieved, you could predict the behavior of the satellite for the remainder of the pass probably well enough to resume open-loop control with periodic closed-loop updates rather than continue 100% closed-loop control.

Another possibility is that your rig can't hear the satellite. When it's on, it is usually running ~1/2 watt. My Standard dual-bander can barely hear it around the best part of a good pass, and that is with the squeclh off and I know what to listen for and where and when to listen.

Adding a low noise UHF GaAsFET preamp works wonders and makes the satellite copyable and usable for much of a pass, even mobile in motion. Alternatively or in addition, a small (4-6 element) yagi can be hand-held and pointed in the general direction of the satellite. Wave it around for best signal reception (azimuth, elevation, *and* polarization).

Downlink center freq is 436.8 MHz, plus/minus doppler.

>There are no other FM birds up and unless there are some plans in the
>works, there will be none in the next few years. P3D does not have any
>provision for FM (although with some careful planning it would have been
>possible.) Other planned satellites are all digital store and forward or
>special interest experimental (semi-commercial.)

Mir and SAREX can be worked with the 2M portion of the radio. If the radio is 9600-baud ready or modifiable, it may be usable on the 9600 baud satellites. My Standard dualbander is 9600 baud ready. It receives the UO-22, KO-23, and KO-25 birds well (filter skirts seem wide enough so 5kHz tuning steps are not fatal) when used with a preamp and omni antenna. I had limited success with the stock radio on uplinks, and suspect either distortions in the TX side (see the recent QST reviews and QEX articles on subject) or misadjusted radio/TNC TX gain levels.

Hi,

You have uncovered a problem with the KCT/T Driver for Windows. I never intended it to work with Win95 (as It didn't really exist when I wrote the driver!) so it will need to be fixed to work correctly with Win95. If you want, you can install the driver with Win31 then copy the related files over to Win95. Another solution is to hand edit the KCTDRV.INI file.

Why couldn't you just measure the doppler error from the discrimiator (an easy measurement on most satellite rigs) and feed that back into the tracking pc. It could then compare that to it's esimate and update it's prediction (much like a GPS does)?

This seems the easiest method to me...

From: g8tzj@ve4umr.ampr.ORG
Message-ID: <15256@ve4umr.ampr.org>
Source record: 24899

PLEASE be VERY careful when using these Internet mailing lists for AX25 packet messages.

Why ? Well I get the Digest version of this mailing list and it is forwarded to me from the Internet / TCPIP gateway to my AX25 BBS. If one of the digest messages contains the /EX characters (or even CTRL-Z) on a blank line then I LOOSE ALL the remaining items in the digest !

Digest #147 is a VERY good example of this where the first message is the SPACENEWS packet bulletin sent by John Magliacane which ended with /EX which any AX25 BBS interprets as END OF MESSAGE. I therefore lost all the remaining 6 messages in this digest file. I also lost a previous digest in the same way but is was a different sender that was responsible.

I will now have to try and FTP this file as the topic list shows a reply to a message that I replied to. This is not easy for someone like me who only has limited E-mail access to the Internet. Fingers crossed that the FTP-MAIL server will get it.

If you must send packet mail via Internet then please EITHER omit the /EX or preccede it with a space E.G.

/EX

as this will not affect the transfer to the packet network.

(signatures trimmed to conserve bandwidth a little)

Traksat will also choke on the "end of file" marker. It wants "just the facts."
Also, a co-processor is very helpful, this program is more math intensive than
other tracking programs.
Traksat 3.1 has some better features, but no support for XTs. Avoid ver 3.0.
I love the maps and the ability to customize the look.
I wish it came in OS/2 flavor.
Finally, I haven't registered yet, shame on me.

Jim n7tcf@primenet.com

Following is a public domain BASIC program I used to convert my
own coordinates to a grid square. I found it on the Chestnut Ham
Radio CDROM, version 3.2. I run it on my Windows NT system using
QBASIC which comes with NT but you should be able to use it with
just about any BASIC you have handy.

1198. Two-Line Orbital Element Sets (TLE615)

Newsgroup: rec.radio.amateur.space
Date: 1995-06-03 00:00:00 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.802212958@dolphin>
Source record: 24904

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (334) 409-9280, and are updated daily (when possible). Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at speeds up to 14,400 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily) and some documentation and software are available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space.news and rec.radio.amateur.space. This week's elements are provided below.

```

1199. Will 7 1/2' crossboom work for Mode B & S?

Newsgroup: rec.radio.amateur.space
Date: 1995-06-03 00:00:00 UTC
From: gsnellgr@scsn.net
Message-ID: <3qqpmc$3g2@news.scsn.net>
Source record: 24905

I asked a simular question before, but this time I will be more specific. I want to put an M2 2MCP14, an M2 436CP30, and a Bob Myers Mode S parabolic antenna on a 7 1/2 foot crossboom. Will it work ok? If so, what should the spacing be between the various antennas? Your input would be most appreciated.

Thanks,

Greg, KN4NO

I have ALMOST this configuration - except using the M2 10' boom. I have the two CP antennas at the ends of the boom, and the Mode S as close to the center as possible (so it clears the rotator) on the 436 Mhz side to be as many wavelengths away from the others as possible. It works!

Yes, there is. The very same version of SatTrack (V3.1) can be compiled for usage without X Window color graphics. All you need to do is to NOT include the flag '-DXWINDOW' in the compiler options and comment out the X11 libraries in the linker options (all in the SatTrack Makefile). You can then still run either the numerical live displays or the predictions.

As an example for the predictions (for 40 cities in the US), and yes, with orbit numbers, check the other web page:

http://ssl.berkeley.edu/isi_www/satpasses.html

The orbit numbers for the shuttle are somewhat tricky because it seems that NASA and NORAD use a different counting scheme. The NORAD numbers increment when the spacecraft passes through the perigee, whereas the NASA orbit numbers increment when the spacecraft crosses the equator on the ascending node. That is why you have to specify either NASA or NORAD, depending upon where the two-line element sets came from.

Many thanks....I'll give it a try ! I forgot (or didn't know) that
source code was included...a natural invitation for me to "play" !!! :-)

> The orbit numbers for the shuttle are somewhat tricky because it seems that

Not really interested in the Shuttle.....I'm more into the NOAA polar
orbiters. I file the raw APT data files with the orbit number, and
generate a caption on the final GIFs with that and the time/date
information included. Right now I am using a DOS program, which means I
have to enter the number manually as the prediction table I get doesn't
include it.

I'll keep that bit about the TLEs in mind, though, when there's a
high-inclination mission. Normally I get the TLEs from Dr. T.S. Kelso,
and they're in NORAD format.

Thanks again for the comeback.

I believe that Friday in the paper here in Iowa there was
a mention that one of the shuttles that is waiting to go into orbit may
be delayed for quite some time.

It seems that there are some woodpeckers down there that have
decided the shuttle external tank is a good place to look for dinner.
There are supposedly several holes that have been made in the insulation
of the tank. One of the holes, if memory serves me right, is about 6
inches in diameter.

There is investigation going on at this time to determine the
best way to repair the holes in the insulation. But there was also
mention that the flight could be delayed for weeks if not months in order
to do the repairs.

You most likely ftp'ed an old version of SatTrack. The most recent version is V3.1, and that runs well on Linux systems (and also on Sun, DEC, IBM and HP UNIX workstations), and sure has X11 color graphics. Check the web page at

http://ssl.berkeley.edu/isi_www/sattrack.html

for more information. You also can get the V3.1 distribution file from this web page.

I'm not quite sure what is meant by "doppler error". Error relative to what?

In any case, the observed doppler shift is independent of the antenna beam position, so measuring the doppler shift won't provide any angular error information with which to steer the beam.

The decision has been made to rollback Discovery (STS-70) to the Vehicle Assembly Building where it's easier to get access to the woodpecker holes and perform the repairs. While this will result in a couple of months delay to the STS-70 mission overall it isn't that big an impact, and actually helps many experiements - especially SAREX.

The next shuttle up is now Atlantis on STS-71 which will be the first docking with the Russian Mir Space Station. SAREX is onboard in the -M configuration (Mir radio for voice only). Please note that the new frequencies will be used for random voice contacts (check the official SAREX bulletins or this month's "Satellite Times" for the list).

NASA Shuttle mangers have not decided yet which order the next shuttles will fly, but it's a pretty good bet that Endeavour will fly on the STS-69 mission in July as planned (no SAREX *sigh*) and STS-70 will follow in August with SAREX.

The advantage to the delay is, with all of the changes to the flight order and the high priority for the STS-71 mission, that STS-70 can now fly a full eight day mission as originally planned - resulting in more time for SAREX, esepcially random QSOs!

So yeah, this is the first time that woodpeckers have resulted in a shuttle mission getting delayed, but in the big picture it isn't such a big deal.

Satellite Tracking by Feedback

Since I started this thread I have been thinking - taking account of the various (public and private) responses to my original half-baked idea of tracking satellites by feedback without the use of ancilliary antennas. I thought I had invented conical scanning - ah well that's how it goes.

What about this: I have seen a Victorian gyroscopic toy where a flywheel, gimbal-mounted about 6 inches above a base-board, has a non-rotating stylus rod like a knitting needle attached to the gimbal frame, co-axial with the flywheel axis. This projects downward to the baseboard, on which there is a raised irregular shape such as a complicated jigsaw puzzle piece or a maze. The stylus can swing to touch the side of this shape. When the flywheel is spinning the stylus uncannily follows the edge of the shape as if it were intelligent. I think it relies the fact that when a gyroscope is nudged one way it moves off 'willingly' at right-angles. In this way, the stylus remains in contact with the profile of the shape and traces its way around the periphery - be it concave or convex.

It seems to me that this principle could be used to: make a conical scanning tracking dish; overcome some of the objections based on fading; and at the same time remove the need for any rotators.

My proposal is this. First the basic idea, followed by some thoughts on the practical side:

The feed-horn would be on the axis of spin but would not spin. The dish itself would double as the gyroscope flywheel and be of such a shape that it aimed the signal at a constant angle off-axis (really we are talking about reception here of course). This would produce a conical scan. The signal strength around the conical scan is memorised and used by a computer program to determine the direction the dish must be tilted next. If the dish spin speed is fast enough there would not be much time for fading to occur. Up to 8 revs/sec seems quite realistic (see below)

Now some thoughts on the practicalities: First the dish/flywheel. As described above the dish would have to wobble. Indeed to produce conical scanning it must wobble in a radio sense - but as a flywheel it must run true. Balance weights could be added to give it a symmetrical moment of inertia. But it would still waft a lot of air around.

I don't know if the following idea is sound so I would welcome comments:

First imagine a convential 30 inch dish embedded skew fashion in a cylindrical flywheel of expanded polystyrene. This would still need balancing weights. Is styrofoam transparent to typical dish freqencies? - if so the balancing problem can be reduced by using instead of the

embedded conventional dish a layer of metal foil pasted to one half of a styrofoam block (cast on a readymade dish) before pouring the other half on to it. The dish no longer needs to be strong in its own right because its shape is maintained by the styrofoam sandwich. So far so good if styrofoam is radio-transparent (I have seen photographs of dishes on mountains said to be unaffected by a covering of snow - but don't know the frequencies)

So we now have a styrofoam flywheel say about 9 inches deep and 30 inches diameter. This might need its outer 9 inch high edge skinning with a heavy-ish insulator - say fibre-glass, to increase its swing weight.
This flywheel can be screwed to a face-plate attached to the shaft of an electric motor, balanced up, and mounted in suitable gimbal frames.

Speeds: 500 rpm is approximately the speed of a motor-car wheel travelling at 40 mph, so that does not seem to be an unreasonable speed.
500 rpm is approx one rev in 125 msecs. Does significant signal strength fading occur in that time interval? I suspect not (but I am a newby) - if not - slower revs might be adequate.

The attractive feature of this scheme (if there is no fundamental flaw in the idea) is that gentle 'nudges' (applied by solenoids) in appropriate directions should cause the flywheel/dish (+ horn) to swing 'willingly' in the desired direction. The feedback system would be designed to maintain constant signal strength throughout the rotation, but for much of the time there would be a flywheel-speed fluctuation in signal strength which may not be acceptable.

A spherical or parabolic dish shape would probably be good enough, although not the theoretically correct shape for use with an off-centre feed horn.

I should add that my original idea was not to track satellites in the sense of determining their actual orbits, nor to find a method of tracking satellites that would not rival top-of-the-range antenna arrays accurately aimed by prediction, but to find something cheap that would perform better than stationary egg-beaters, turn-styles, whips, etc on the other hand.
Ie, something to fill the gap between the two extremes. So I am assuming a situation where the signal is pretty good, and where my system would be good enough if it could just 'slop it around' within 20 degrees or so of the true direction

At my time of life I am not aiming to develop a this as commercial product. So (in what, as a newby, I understand is the spirit of the hobby) I hearby declare that I claim no proprietory rights in this idea, and donate it as a sort of gift (for what it is worth, and be made to work) to the amateur radio fraternity. Equally I disown any liability for spinning flywheels bounding across rooftops, etc! On the other hand if anyone should want to call it the 'G7UPH gyro dish' I have no objection. But I would not deserve it because, apart from some simple experiments with bicycle wheels, I have not yet built one, let alone made it work!

Space Bulletin 007 ARLS007
From ARRL Headquarters
Newington, CT June 5, 1995
To all radio amateurs

SB SPACE ARL ARLS007
ARLS007 SAREX STS-70 postponed

Space Shuttle Mission STS-70, which is scheduled to carry the Shuttle Amateur Radio EXperiment, has been postponed. Mission managers have decided to repair damage done by woodpeckers in the foam insulation of the external fuel tank. The foam prevents ice from building up on the tank. The repairs will be done at the shuttle Vehicle Assembly Building, requiring the Space Shuttle Discovery to be removed from the launch pad during the week. The mission may be rescheduled for sometime in August.

Mission STS-71, which will also carry the Shuttle Amateur Radio EXperiment, is still scheduled for no earlier than June 22. Following a Flight Readiness Review last Friday, mission managers decided not to select an official launch date due to ongoing work aboard the Russian Mir Space Station that needs to be completed prior to the Space Shuttle Atlantis' rendezvous and docking. The launch team at the Kennedy Space Center will continue vehicle processing work so that Atlantis will be ready for launch anytime on or after June 22. An official launch date is expected to be announced in about one week.

Thanks to SAREX Working Group member Matthew Bordelon, KC5BTL, at NASA Johnson Space Center and the Kennedy Space Center Public Affairs Office for the preceding information. For more information about SAREX, contact the American Radio Relay League's Educational Activities Department.

I would appreciate any help on demodulating satellite signals. I'm particularly interested in receiving ir images. Unfortunately, I don't know where to look for the information on receiving the signal and translating using a PC or Mac. Any ideas would be enthusiastically received.

might i ask of which sats? it sounds like you are interested in WeSats...
look around on HAMRADIO ftp sites for "JVFAX??.zip" and "HAMCOMM??.zip"
the jvfax is a sstv/fax program i use <although i haven't got a quality pic
outta it yet from NOAA sats> and hamcomm has the stematic <sp?> for the
interface from ur radio to computer

have fun! ;-)

SB NEWS @ AMSAT $SPC0605
* SpaceNews 05-Jun-95 *

BID: $SPC0605

=========
SpaceNews
=========

MONDAY JUNE 5, 1995

SpaceNews originates at KD2BD in Wall Township, New Jersey, USA. It is published every week and is made available for unlimited free distribution.

* AO-10 WORKING WELL *
======================
Dave, G1OZO reports that AO-10 is working well. He made 45 contacts between 04-May-95 and 30-May-95 that included the USA, Ukraine, Finland, Canada, Italy, U.K., Holland, Spain, Czechoslovakia, Belgium, Poland, Germany, Austria, and Saudi Arabia using just 25-watts of uplink power. Dave has been active on satellites since 04-May-95. It sure sounds like he is having quite a good time in his new activity.

* HS2JFW ON AO-13 *
===================
James Tudehope, KL7QR, of Valdez, Alaska worked Joe, HS2JFW, from Bangkok, Thailand at 21:20 UTC on 20-May-95 on AO-13 on a downlink frequency of 145.868.250 MHz. Joe was on CW and James could copy him at 529. KL7QR often works Carl, VE8CF, from Inuvik, North West Territories. Carl is located on the north slope of the North West Territories. James has worked Inuvik on AO-10, AO-13 and FO-20. He always enjoys listening to Carl complain about the weather up there. Usually James will have QSOs with people down south who always tell him how beautiful their weather is. James finds it nice to work Carl in Inuvik who seems to always have weather worse than he does in Alaska. :-)

* TRACK SATELLITES ON THE WWW *
================================
A new web page will allow users to determine when certain selected spacecraft will be in range for visual observations or for radio communications.

Data are presently provided in tabular form for 36 major cities in the United States and for four different satellites: the current or upcoming Space Shuttle Mission, the Russian Space Station Mir, HST and UARS. The predictions are calculated every night for 6 days in advance, and

even more often during shuttle flights.

The URL is:

http://ssl.berkeley.edu/isi_www/satpasses.html

Suggestions are most certainly welcome.

Enjoy,
Manfred Bester --- W6/DL5KR
manfred@ssl.berkeley.edu

* SpaceNews BBS DOWN *
======================
Mario, KD6ILO, reports that his SpaceNews packet radio BBS is down due to a fire in his apartment on 16-May-95 that was the result of arson. He lost all his equipment to fire and water damage. The fire is still under investigation, and Mario will inform us when he is able to serve the Pacific Northwest with SpaceNews and other Amateur Satellite news and information.

Where can I find a list of operational amature radio birds.

A few years ago i uplinked to one, it was 144 up and 440 down. Is this bird still alive ?

Is it possible to uplink to a bird and send a email message to it that will be downloaded to the net later ?

Thanks for any info

I'm going to buy a new HT but one of my questions is this:
Can I *really* work sats. with just 5 Watts or less??
Do I need a VHF/UHF dual band equipment or is a VHF/TX- UHF/RX
good enough to do that???
Thanks in advance for your help.

1224. Nova and the KC Tracker

Newsgroup: rec.radio.amateur.space
Date: 1995-06-06 00:00:00 UTC
From: gachaney@iquest.net
Message-ID: <gachaney.6.0013B54F@iquest.net>
Source record: 24830

I have not been able to get my Kansas City Tracker Tuner set up to operate properly with the Nova 1.0 software. The tracker part works fine but I get nothing from the tuner part. I know fom the KC test program that the tuner is communicating properly with my Yaesu 736.

I would like to see what bat file you use to run the KC TSR's ... Or maybe there is something else I am overlooking. The tuning worked fine with an external serial adapter using the direct mode in Nova, but no luck so far with the TSR mode..

Any sugesstions would be appreciated.

Edward, AMSAT is supported by membership dues and sales of tracking software.
Our support of this is neccessary to the launching of all the Amateur satellites.

If you are doing tracking of the Amateur satellites, supporting the organization
that builds them and pays for the launching, will help to keep some of them
in space for you to track

try AMSAT, there home page is
http://www.amsat.org/amsat/AmsatHome.html

or you can ftp:

ftp.cs.buffalo.edu

look for the file "faq_satellite" in /pub/ham-radio directory.

>A few years ago i uplinked to one, it was 144 up and 440 down. Is this bird

>still alive ?

It depends on which one you are referring to. There are currently working
birds with this configuration. You will need a good set of antennas!

>

I have "found" a little box titled;
NavCoreV GPS Development kit Rockwell International

It has an antenna and a RS232 interface.
I think it is some sort of GPS reciver ;-) , I have tested to connect
it to my computers RS232 interface and i am reciving some sort of data...
Once a second i get about 100 byte of "non understandable" yunk.

Does anybody know anything about this "thing"?
What baudrate it operates on, how I can get anything out of the data,
and so on.

Johan

>digging into the converter can anyone tell me if I should ahve heard the
>beacon on Sunday Morning 16:00 - 1800 Z. Iv'e heard that satellite attitude
>can be issue...

The schedule is the big issue. The beacon is on for a short while from MA 110 to MA 112, then later for a longer period from MA 135 to MA 140. During these times, pointing angles should be pretty good for as long as the bird is visible.

The first thing I check when I turn on my converter is the noise level on the reciever. With my FT-736R, I get about S 2-1/2 of noise with no other signal. The greater noise than usual is due to the conversion gain (mostly) and the 5 db of noise from the converter.

When you get more meter reading from connecting the unit, just tune around for the beacon. I seem to remember that it is actually a bit higher in frequency, more like 2400.680 or so, before Doppler shift.

There are also some 2400 signal sources available that can help you tune up and get your antenna set up just right. These are a good idea, as you can use them to test the pre-amp effectiveness as well.

Have fun on Mode-S! I do it when I get the chance, and I don't even bother with noisy Mode B anymore.

>parabolic antenna on a 7 1/2 foot crossboom. Will it work ok? If so, what
>should the spacing be between the various antennas? Your input would be
>most appreciated.

The longer the wavelenght, the more area is needed around an antenna. This means that the 145 mHz antenna needs the most room, while the little dish needs the least.

The kink in all of this is that the 145 mHz antenna is also the heaviest, and therefore weight and balance says that it should be the closest to the rotor to keep thins in balance.

Ouch! The dish will help to keep things in balance a little, though. Put it on the same side as the 435 mHz antenna, next to the rotor, and that will help to keep things in balance better. Assemble everything on the ground first, and keep moving the boom around through the rotor until a balance point is found.

Also be sure to get the antennas balanced properly for each one on the boom by moving the clamping point fore and aft along the antennas boom. Don't forget to have a representative piece of coax for each antenna, as this will effect the balance as well.

Once balanced, your rotors will last a LOT longer! Then, you can experiment with spacing along the crossboom to get the best spacing you can for antenna performance while keeping the setup balanced.

It seems like a lot of work, and it can be, but it is worth it to not have to go up again to replace an expensive rotor.

Hi there

I think I worked with this "thing" not to long ago. It is probaly
a Rockwell NavCore MicroTracker. It has its own protocol and
embeddes some bits and bytes in it with some none standard floating
point numbers. Both are described in a manual, which is about 200
pages long.
For you this means either you die unknowing the secrets of this
"non understandable" junk or you get the documentation from Rockwell
(or sombody else near you).

Keep smiling

1243. Orbit 360 az-el rotors

Newsgroup: rec.radio.amateur.space
Date: 1995-06-09 00:00:00 UTC
From: Wayne_Estes@csg.mot.com
Message-ID: <9506091539.ZM12968@SALCIUS2>
Source record: 24849

Does anybody know the name of a company that sells "Orbit 360" light-duty
rotors with a custom-made mounting plate that adapts them for az-el use?

I have one that I bought used, and a friend would also like to get one.
I don't know where mine came from when it was new.
The mounting plate looks commercially made - not homebrew.

quoting c002@lehigh.edu (David Roseman) in a message to
blkaddr@primenet.com (Blackadder)

C>might i ask of which sats? it sounds like you are interested in WeSats...
C>look around on HAMRADIO ftp sites for "JVFAX??.zip" and "HAMCOMM??.zip"
C>the jvfax is a sstv/fax program i use <although i haven't got a quality pic
C>outta it yet from NOAA sats> and hamcomm has the stematic <sp?> for the
C>interface from ur radio to computer

Hi David,
the program "JVFAX7.0" is a good suggestion as its freeware and works
fine. But you`ll never get a NOAA (or any other Wesat-) picture with
the simple Hamcom-modem, as the modulation is AM.
For wefax and sstv on shortwave you can work with an Hamcom-modem as
this is FM, although the pictures are poor quality. I recommend a
better interface, you`ll see significant improvement.

ciao, Klaus (klabot@tdd.snafu.de)

1248. Sources for Elevation Rotators?

Newsgroup: rec.radio.amateur.space
Date: 1995-06-10 00:00:00 UTC
From: blanton@ni.net
Message-ID: <blanton-1006950710550001@xband.ni.net>
Source record: 24854

I've been searching the amateur catalogs for elevation rotators but so far I've only found the two from Yaesu: G-500A (El only) for $309 and G-5400B (Az/El) for $589. These prices seem a little steep and I thought that there would be more choices than that. Does anyone know of any other manufacturers or sellers of elevation rotators, especially lighter-duty/lower-cost units?

Thanks,
Lee, WA8YBT/6

What you have is a Global Positioning System modual. It sounds very simalar to one that a friend has. That unrecognizable junk that you are recieveing is in fact GPS data. The problem with the Rockwell units is they use proprietary software that has a nonstandard data format. The GPS unit can be set to standardized positioning formats that programs like APRS can understand. It is although a bit tricky even with the manuals that go with the unit. This is about all I can tell you without actually having documentation in front of me. I hope it helps.

Look for rotators from Alliance, the U-100 or the U-110. Amateur Electronic Supply used to have them and they are pretty common at hamfests. They used to cost about $70 new. I've been using one for 6 years or so, with a KLM40CX and a Cushcraft 20 el crossed yagi for AO-10 & 13 and they work great.

You have to make sure your antenna load is balanced, and they don't lend themselves to computer control, but the price is right.

1254. Stacking Sat. Antennas

Newsgroup: rec.radio.amateur.space
Date: 1995-06-11 00:00:00 UTC
From: dunaway@magicnet.net
Message-ID: <3rdg8l$43q@comet.magicnet.net>
Source record: 24860

I have a question about the pro/con of stacking sat. antennas.
I have heard people talk about stacking 2m and 70cm antennas 2 ways,
as i'll attempt to diagram below

```
70cm 2m
| |
+------------rotor-------------+
| |
70cm 2m
```

OR

```
2m------------70cm----rotor----70cm----------2m
```

Is there any pro/con over these 2ways?

What is the proper spacing of the 2m/70cm antennas for both means?

Thanks for any feedback

Stewart - KE4SCY (dunaway@magicnet.net)

Lee,

Many sat-ops use a rotor from Alliance. This is a standard TV antenna type rotor with the unique feature that the mast can slip thru the rotor. Many hams have taken to mounting them horizontally in this manner for elevation control. The rotor costs about $ 100 new. It must be protected from water when mounted like this so you should ask around but it has been a very popular low-cost method for elevation control. Most of the satellite publications (how to get started, etc.) mention this rotor by part number and detail how to protect it.

Good luck, 73

I have found the Alliance style rotor here is Phoenix for $70 at a certain large
home discount store.

I know this is not the swap area, but have some items for sale which may be of interest to satelite operators so I am listing them here.

First I have a SSB 2000/01 mast mounted downconverter. This is the one with 30+ dB of conversion gain. This unit works excellant with the new Myers Mode S antenna I also have for sale. Both are less than 1 month old and neither has been in the weather. I want $375.00 for the downconverter (current price is $459.00) and $50.00 for the antenna. These prices are shipped in the 48 states. I will take $400.00 for both.

I also have a Mirage D-3010 for sale. It is also less than 1 month old and in new condition. I will take $250.00 for it shipped.

You can reach me at (803) 356-0769 or via e-mail. I will except a money order or cashiers check or I can ship COD if you are willing to pay the COD charges.

Thanks and 73,

Greg Snellgrove, KN4NO

1259. ST-1 Sat Tracker, parallel & serial port?

Newsgroup: rec.radio.amateur.space

Source record: 24765

I was reading the literature about the ST-1 that AEA sent me and it talks about using the parallel and serial port's to talk to the computer. On the parallel port do you need a bi-directional port? Or does it just go one way, out? Like for printers. I can't imagine that you would need the parallel port because there is so much information to pass. Thanks in advance.

If you re-post this question to sci.geo.satellite-nav you'll probably find
someone there who can give you all the data you need.

Cheers ... Peter.

If yopur looking for Jupiter on 26 Mhz just about any general coverage
shortwave receiver will work...You may want to add a preamp and a directional
antenna to point at jupiter. A Jupiter-io transmission sounds like a big wave
crashing on the beach..

There was an artile inQST a few months back I think...Tweo guys tried to
listen to the comet crash....There is a description of their equipment in the
article.

There have been some recent postings regarding where to obtain satellite tracking software. The best source that I know of is AMSAT at (301)589-6062. There is a FAX number also: (301)608-3410.

AMSAT membership can be obtained at the same numbers and will include discounts on the software. When I joined there was some shareware included with the membership package. A lot of information on how to use the birds comes with the membership package plus all profits go toward building and launching more satellites.

Ken K5MBV AMSAT member # 28079

The parallel port handles the communication between the computer and the ST-1.
The serial port talks to your radio to control its frequency.

Bill

* MAYDAY TRAFFIC PASSED ON AO-16 *
==================================
Troy, ZL1UOP, recently passed a MAYDAY message received from Salomon Atoll, Chagos Archipelago, in the Indian Ocean. The message, dated 31-May-95 at 17:37 UTC, read as follows:

Vessel G, a small fishing vessel called mayday. Drifting close to south Salomon Atoll. Vessel G has three person on board and has lost its Mother Ship TALBOE 3. The Talbo 3 is Mauritius registered. Communication with Vessel G, Have ceased and a Hand Held Flare has been seen.

Contact With Deago Garcia is required. Please contact a Rescue center and pass this information on. Deago Garcia can contact us on 2182 KHz.

Mark Shepherd, ZL1TRE of Auckland, New Zealand, picked up the message and quickly pass it on to Search & Rescue in Wellington. Graeme, VK2ZIS, of Port Macquarie, Australia also picked up the message and passed it along to the Australian Maritime Rescue Coordination Centre. Terry, ZL2AHK, in New Zealand passed message to the Honolulu Rescue Center.

On 01-Jun-95 at 06:05 UTC, Troy, ZL1UOP posted the following message as a follow-up to his original MAYDAY traffic relay:

To : ALL
From: ZL1UOP
Time: 060551UTC
Date: 01 Jun 1995

Hello, If you have replied to the Mayday, Many thanks for helping.
We have managed to contact Deago Garcia (14 hours late). The Fishermen were rescued by the Mother ship early this morning. Today 4 boats came from the mother ship and thanked us for our Help etc....

Sorry if I have caused any inconvenience, but Communication with Deago Garcia (a major US Naval base 100 nmls away) is difficult from here.

Bye Bye.... Troy ZL1UOP@AO16,LO19 6s 73e

[Info via VK2ZIS and the AMSAT-OSCAR-16 Satellite]

* NEW STS LAUNCH DATES SET *
==========
NASA mangers have set new target launch dates for two Shuttle missions scheduled to fly this summer. Space Shuttle Discovery on Mission STS-70 is now targeted for launch on July 13 and Space Shuttle Endeavour is set to be launched on Mission STS-69 on July 30.

The new flight dates for Discovery and Endeavour have no impact to the processing work on Space Shuttle Atlantis being prepared for the STS-71 launch on the first Shuttle-Mir docking mission. The Atlantis launch remains planned for no earlier than June 22 and a firm launch date may be announced early next week.

The new target launch dates for Discovery and Endeavour were established after the launch team finished assessing the impact of last week's decision to roll Discovery off Launch Pad 39-B. The rollback was required in order to make repairs to the foam insulation on the external tank.

[Info via NASA]

* STS-71 MISSION PROFILE *
==========
The following describes the nominal mission orbit profile for STS-71. This is an historic mission in that it represents the first docking of the U.S. Space Shuttle with the Russian Mir Space Station. During this mission there will be a crew change and the crew returning to Earth on the Shuttle will be different from the original crew.

The scheduled launch time is 24-Jun-95 / 20:42:50 UTC.

The mission will have a 51.6 degree orbital inclination.

The orbits for STS-71 are provided in time-independent Earth-Fixed Greenwich (EFG -- a.k.a TDR) position and velocity state vectors. The mean Keplerian Two-Line Elements (TLEs) may be computed from these vectors using the VEC2TLE or V2KEP software (versions 9435 required). Since the vectors are time-independent, the only variable is the launch date and time for STS-71 (see scheduled time above). The launch date/time must be entered into VEC2TLE as a reference time for the vectors, which have time referenced in Mission Elapsed Time (MET). Launch time may be changed/updated as necessary using VEC2TLE.

The VEC2TLE and V2KEP software is available from AMSAT-NA. VEC2TLE is available from several places including a few Internet ftp sites, private BBSs, and on CompuServe.

Below are the reference times and events associated with the STS-71 state vectors. All events in this mission profile represent significant orbit

changes caused by a thruster firing. Therefore, each vector should be used only up to the time of the next vector.

Vector # Time (MET) Rev Event Apogee (km) Perigee (km)
1 000/00:43:03.854 1 OMS-2 297 203
2 000/03:38:50.000 3 NC-1 410 294
3 000/15:01:32.847 10 NC-2 397 310
4 001/03:27:43.673 18 NC-3 411 299
5 001/12:25:05.751 24 NC-4 406 387
6 001/13:57:27.533 25 Terminal Init 412 392
7 001/15:19:33.533 26 Mir Docking 405 391
8 006/07:07:00.000 106 Final Sep. 404 390

Questions and Comments regarding this mission profile should be sent to:

Hi,

JVFAX 7.0 is great, but first of all, you need to construct
a decoder hardware. There are articles discussing the hardware
and software systems in the March,April 1995 issues of 73 magzine.

Hopes this will help.

Just wanted to add my 2 cents worth.... the St-1 is currently not directly compatible with WISP. If you are using WISP for PACSATS, or if you plan to, look at other trackers.... I have an ST-1 (collecting dust) and I have seen many messages from other owners that have replaced them with other trackers... The ST-1 is a good idea but it seems to be a poor implementation and AEA appears to not be supporting it... On the other hand ... if you are willing to dedicate a PC to operate in stand alone tracking mode with the ST-1, I have heard that works... then with a second PC you can operate the digital satellites... seems like a waste to me...

For me... I puchased a TRAKBOX from TAPR and after a minorinitial problem with the CAT port (my fault) I have been very happy with it... I have also heard good things about the Kansas City Tracker... but the best feature of the TRAKBOX is that it doesn't tie up a slot or any ports on the PC... yes you need a serial port and terminal emulator to set it up and to update the keps ... but other then that it runs stand alone ... it is a good product .... I have also seen some messages recently implying that there is a new hardware implementation of TRAKBOX out .... but I do not have any facts about that ... if anyone out there knows... please drop me a line ... Thanks...

73 & Good Luck with auto tracking....

Yes, it does indeed use the parallel port. If you want to tune the radio, it also uses a serial port. You don't need a "bi-directional" parallel port, though. Parallel ports do have lines going TO the computer, just not 8 or 9 bits wide for fast transfers.

I looked at the ST-1, and I didn't like it. Using two ports is a waste. I bought the Sat Trak IV instead. It works very well, and uses one serial port only.

1270. Two-Line Orbital Element Sets (TLE620)

Newsgroup: rec.radio.amateur.space
Date: 1995-06-13 00:00:00 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.803010420@dolphin>
Source record: 24776

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (334) 409-9280, and are updated daily (when possible). Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at speeds up to 14,400 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily) and some documentation and software are available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space.news and rec.radio.amateur.space. This week's elements are provided below.

>>> Why couldn't you just measure the doppler error from the discrimiator
(an
>>> easy measurement on most satellite rigs) and feed that back into the
>>> tracking pc. It could then compare that to it's esimate and update
it's
>>> prediction (much like a GPS does)?

>>I'm not quite sure what is meant by "doppler error". Error relative to
what?

Simple, error relative to your prediction.

>>In any case, the observed doppler shift is independent of the antenna
beam
>>position, so measuring the doppler shift won't provide any angular error
>>information with which to steer the beam.

Once again, this is just an update of the prediction. This one of the
major data elements that NASA/JPL uses to compute the element sets in the
first place.

The original subject of this thread was 'satellite tracking by feedback' -- that is, keeping the antenna pointed at the satellite by means of a closed-loop feedback control system without requiring accurate predictions of the satellite's position. Of course, if one can accurately predict the satellite's position in the sky during a pass then a closed-loop tracking system is not needed.

Accurate ephemeris data and satellite tracking/prediction programs are readily available. The satellite data is updated regularly, primarily by Air Force and Navy sensors, so an individual need not try to independently determine the satellite's orbit except perhaps as an educational exercise.

Hi,

Does anyone know what is up with GMS-5? The c-elements say the bird is up
at about 159E. When the cutover happenned, it transmitted from GMS-4's location.
Is the data from the new bird being transmitted to the old one until it reaches
station?

I have estalished a WWW site that includes the 1st ever Ham opinion poll.
The question this month is "Do you support the new vanity call program,
about to go into effect in the US?" The poll takes into account license
class and the age of the voter. Your vote is tallied instintly and you see
the results on-line.
Check this site out at, http://www.csz.com/sarrio.html.

This message describes the rec.radio.amateur.*, rec.radio.cb, rec.radio.info, and rec.radio.swap newsgroups, as well as their Internet mailing list counterparts and complements. It is intended to serve as a guide for the new reader on what to find where. Questions and comments may be directed to the author, Jay Maynard, K5ZC, by Internet electronic mail at jmaynard@admin5.hsc.uth.tmc.edu. This message was last changed on 31 October 1994 to add the discussion of non-Usenet mailing lists and streamline most of the history discussion, and to change the moderator information for rec.radio.info.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions were held on the mailing list, and sent to the mailboxes of those who had signed up for it. When the Usenet software was created, and net news as we now know it was developed, a newsgroup was created for hams: net.ham-radio. The mailing list and the newsgroup were gatewayed together, eventually.

Over the years, as the net grew, the volume of discussion became progressively higher. First one by one, and then as part of two reorganizations, what was once one group became many. In the process, developments elsewhere on the net were reflected in the groups as they were created, most notably the change to place all of the ham radio groups in one hierarchy.

The collection of newsgroups continues to grow as more people join the net, and as more topics of discussion gain volume, I expect to see more groups be created as well. This follows what is happening on the rest of the net.

Nearly all of the radio newsgroups have corresponding mailing lists, the notable exception being rec.radio.swap. There are also a few mailing lists that don't have newsgroups.

The Current Groups
==================

It's important to post messages to the group that's appropriate for them, and not to the groups that aren't. The whole idea of having different

newsgroups is so that folks who aren't interested in, say, homebrewing, don't have to wade through messages about homebrewing on the way to read about Field Day. Posting appropriately is just good etiquette.

The rec.radio.amateur.misc group is the catchall. It is what rec.ham-radio was renamed to during the first major reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, was removed on September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there. To answer a frequently asked question: No, there is no mailing list that goes along with this group. If you can't read Usenet news directly, you're out of luck.

The group rec.radio.amateur.policy was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate - it's now legal to order a pizza on the autopatch, if you're not in the pizza business - as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The group rec.radio.cb is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently David Dodell, WB7TPY. The email address for submissions to the group is rec-radio-info@stat.com. Inquires and other administrivia should be directed to rec-radio-info-request@stat.com. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups rec.radio.amateur.antenna, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

Mailing Lists

In addition to the mailing lists that mirror the Usenet newsgroups, there also are a few that stand alone. These cover specific areas of ham radio, and discussion is focused on just those areas.

The cq-contest mailing list is for discussions of contesting in ham radio. To join, send email with the word "subscribe" on a line by itself to cq-contest-request@tgv.com.

The DX mailing list covers the finer points of DXing. This one is also joined by mailing "subscribe" on a line by itself, this time to

dx-request@unbc.edu.

There's also a VHF mailing list, for VHF operators of the weak signal persuasion. You can join this one be sending "subscribe vhf" on a line by itself to vhf-request@w6yx.stanford.edu.

All of the following mailing lists are sponsored to the Boston Amateur Radio Club, as well as some others of local interest. Thanks to N1IST for the information.

qrp-l: This is the qrp mailing list, previously maintained by Bruce Walker at Think.com. It is for discussions about the design, construction, and use of qrp (low power) radios and related equipment.
arrl-ve-list: This is a one-way list, run by Bart Jahnke of the ARRL VEC, for announcements to VEs and VE teams.
w1aw-list: ARRL bulletins, news, and information
newsline-list: Redistribution of Amateur Radio Newsline
letter-list: Redistribution of the ARRL Letter
fox-list: Fox hunting and Radio Direction Finding
fieldorg-l: ARRL field organization discussions
ham-tech: Technical discussions and questions about Amateur Radio
arrl-exam-list: amateur radio license examinations scheduled in the US and in some foreign areas.

To sign up or inquire about these lists, send mail to listserv@netcom.com with the following in the body (subject is ignored) of the message.
<listname> is the name of the list to subscribe to.
To subscribe: subscribe <listname>
To unsubscribe: unsubscribe <listname>
For more information: help
To post (to the two-way lists), send your message to <listname>@netcom.com

Please do NOT send subscription requests to the mailing lists themselves; that doesn't work very often, and is very annoying to those on the list. Also, please keep your electronic mail address current with any mailing lists you subscribe to, as dealing with returned email is a nuisance for the person maintaining the mailing list.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while

still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

I am using a PK 96 and wisp. Trying to make it all work. Getting frustrated. Been working on it since Dayton Hamvention time. So far I have the program setup I think....The Rotor control and radio control is working. Its seems to initialize the TNC...I don't know that for sure. What I mean by that is it says it is initialized but I don't know if the TNC is supposed to say something back. When a satellite comes up the rotors take off and do their thing. The radio takes over for freq. and doppler but not all the time. It seems like the program isn't talking to the TNC. The only thing the TNC does occasionally is the DCD flickers once in a while. Any suggestions ???

1288. TRAKSAT satellite tracking software

Newsgroup: rec.radio.amateur.space
Date: 1995-06-16 00:00:00 UTC
From: phubbard@baosc.com
Message-ID: <9506161957.AA03224@hawaii>
Source record: 24794
Cross-posted to: rec.radio.amateur.space,sci.astro.amateur

Hello,

I need to know where I can obtain TRAKSAT; a program written by Paul Trauffer of Huntsville, AL, for PCs. My brother needs it for an upcoming amateur radio contest (thus the weird cross-posting), but unfortunately, the hard drive on my PC is temporarily out to lunch, including, not only TRAKSAT itself, but the listings of any BBS's I might have gotten it from...

It doesn't have to be a BBS; anonymous ftp sites are fine as well. And, if you don't know where to find TRAKSAT, but know of a good satellite tracker for DOS, I'll gladly take that information as well.

Please note: I don't have access to Usenet, and I'm using an email-to-Usenet gateway to post this. So, please send replies directly to me instead of to the group, or I won't see them. I will post a summary early next week.

Thanks in advance,

Phil Hubbard

A good place to get satellite tracking programs is the ftp site
seds.lpl.arizona.edu/pub/software/pc/sat.
Tracksat is the files trak300a.zip & trak300b.zip.
stsplus (my favorite) is in the files sop9517a.zip & sop9517b.zip
quicksat is in the file quicks24.zip. this is a prediction program without
any graphics. It does a good job
if your'e into visual observing because it gives magnitudes and sizes
and such. It's free but would be a good investment even if it was
shareware. The newest version is 2.8d but I no not ware. The author,
Mike McCants said he would post the latest but I forgot where. He emailed
it to me.(Thanks Mike).

Message-ID: <tkelso.803349967@dolphin>
Source record: 24799

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (334) 409-9280, and are updated daily (when possible). Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at speeds up to 14,400 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily) and some documentation and software are available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space.news and rec.radio.amateur.space. This week's elements are provided below.

1297. KPC-9612 & WISP Xmit Problem

Newsgroup: rec.radio.amateur.space
Date: 1995-06-18 00:00:00 UTC
From: randyh@gvgadg.gvg.tek.com
Message-ID: <3s1i4o$jk3@gv-gate.gvg.tek.com>
Source record: 24803

I am currently using a KPC-9612 on the 9600 baud satellites. It work very good. But, once in a while, the TNC will not transmit from WISP. I see WISP ask for a file or fill, but the Xmit LED, and radio, don't transmit. When I close WISP and go into a terminal program, the TNC transmits.

I do set the TNC for the following:
maxusers 0/1
mydrop 1/0
int xkiss

Then I RESET the TNC.

When I go back into WISP, it still doesn't go into transmit. I fool around with various parameters, and it start to work. But, I haven't figured out the real fix yet.

And, trying different combinations during a pass is real fun. The only way to test the TNC is with WISP during a pass. Is there anyway to get WISP to transmit without a satellite?

So, does anyone have any ideas?

Randy

Why YES IT WILL! But, they are using new freqs. for the docking missions.
uplinks are: 144.450 and 144.470. The downlink will be 145.840. They
will NOT favor one freq over the other, as always listen first.
Mir will stay on it's normal frequency.

30 To be launched on need in FY '96

Notes
-----
1. NASA Catalog Number is also known as NORAD or U.S. Space Command object
number.
2. No orbital plane position = satellite no longer operational.
3. Clock: Rb = Rubidium; Cs = Cesium; PRN19 clock switched from Cs to Rb
between 94-10-16 and 94-10-19; PRN20 clock switched from Cs to Rb between
94-08-06 and 94-08-17; PRN31 clock switched from Cs to Rb on 95-01-18.
4. S/A had been enabled on Block II satellites during part of 1990; S/A off
between about 10 August 1990 and 1 July 1991 due to Gulf crisis; standard
level re-implemented on 15 November 1991; occasionally off for test and
other purposes. Currently, PRN15 and PRN28 appear to have little or no S/A
imposed.
5. Anti-spoofing was activated on 94-01-31 at 00:00 UT on all Block II
satellites (ref. NANU 050-94042); occasionally off for test and other
purposes. Anti-spoofing was turned off at 20:00 UT on 95-04-19 and back on
on 95-05-10. On 95-06-19, AS was again turned off.
6. PRN number of SVN32 was changed from 32 to 01 on 93-01-28.
7. PRN05 and PRN06 are equipped with corner-cube reflectors for satellite laser
ranging (SLR). SLR tracking of the satellites will permit onboard clock
errors and satellite ephemeris errors in GPS tracking to be differentiated.
8. The decommissioning date for PRN06/SVN03 is the date of termination of
operations of this satellite (ref. USNO) and is about 3 weeks later than the
date GPSIC gives for "deactivation".
9. The operational frequency standard of PRN32 was changed from a Cs to a Rb
between 95-05-03 and 95-05-12.
10. The operational frequency standard of PRN36 was changed from a Rb to a Cs
between 95-04-27 and 95-05-03.

I run a 9612 with a FT-736r very successfully on KO-23, KO-25 and
UO-22. If you want a copy of my WISP.ini file I can e-mail it to you.
I had a bit of trouble getting going but now it is completely seamless.

1307. Cheap Elevation Rotor

Newsgroup: rec.radio.amateur.space
Date: 1995-06-20 00:00:00 UTC
From: n7tcf@primenet.com
Message-ID: <3s6grl$479@nnrp2.primenet.com>
Source record: 24565

This is an eternal subject, at least for the four years I've been licensed.

I have been using the old Radio Shack/Alliance rotor found at the swap meet. It sometimes overheated and wouldn't move. So I've been thinking of buying another, the one I posted about. Well I did, here are the facts and conjecture.

Gemini Industries Inc.
215 Entin Rd.
Clifton, NJ 07014

It is a through-the-body style, with a position sensing pot and 5-wire control. It is a DC device however, 13.8 in fact. The bolt spacing is different from the Alliance. For new installations this doesn't matter. It caused a little extra work to replace the Alliance.
The DC nature means the magazine articles aimed at the Alliance must be reviewed carefully. The Alliance was a 24 volt AC device. But 13.8 VDC means much easier hacking and even portable use. The circut appears to be a balance bridge, with light-duty power transitors controlling the motor.
The fit and finish of this rotor is nowhere near as good as the old Alliances I have. I had to file-out the tube before the 1-1/4 cross-boom would slide in. This was a major pain.
The rotor is up and functioning. Now I have to find why my 726 only delivers 3 watts on 435. Someday I will get on the birds.

Can anyone tell me where to get the absolute most up-to-date 2-line orbital element set for the Shuttle, and a pointer to some software (shareware?) that converts this to viewing information (rise/set/alt/az info)? Since the Shuttle will be docking with MIR, I would expect their orbital elements to change a lot, meaning we'll need fresh data to predict passes.

Also, what frequencies does MIR normally use?

(I'm new to this aspect of amateur radio)

Mir uses 145.550 simplex. As for where to get updated shuttle elms
subscribe to the shuttle element e-mail list:

listserv@alsys.com

In message body type subscribe elements your name

then send! You'll get confirmation almost right away.

As for a tracking program use STSPLUS. I don't know which FTP site has
it, hopefully someone can answer that one for you. If you don't have the
latest shuttle elms just track Mir since that's where the orbiter is
headed anyway.

I picked up a new or at least very new condition Alliance u-100 from
norms rotor service.
He is listed in several mags.
cost me a outlandish $45
I mean this is terible price I have seen old broke trashy ones at hamfests and
listed on here for $50.
By the way it worked and came with a warrenty.

1313. References for beginning radio astronomers

Newsgroup: rec.radio.amateur.space
Date: 1995-06-20 00:00:00 UTC
From: phb@syseng1.melpar.esys.com
Message-ID: <phb.803672026@melpar>
Source record: 24571

The following two references are of general interest to those involved (or thinking of getting involved) in radio astronomy at the amateur level. The first article is particularly valuable for the home experimenter, while the second is more a "status of the state of the art" at the professional level (interesting stuff, though):

I. "My Radio Telescope" by Bob Drury (Alberta, Canada), Journal of the Royal Astronomical Society of Canada, Vol. 89, No. 2, April, 1995, pp. 72-80. (contact RASC at 136 DuPont Street, Toronto, Ontario, Canada M5R 1V2. Single copies of the Journal are available for $12.00)

At the age of 13, Bob Drury built a functional interferometer radio telescope for operation at 19 MHz using two corner-reflector antennas with dipoles as driven elements, a "ghetto blaster" with shortwave coverage to 20 MHz as a receiver, and a Rustrak chart recorder borrowed from the University of Alberta. Using this *very* "homebrew" setup he successfully charted a number of astronomical objects including Cygnus A.

This delightful article, written after Bob turned 14, describes the trials of this young experimenter's efforts to successfully enter the world of radio astronomy, from rabbits nibbling on his coax to successfully modifying his receiver for improved RF sensitivity and proper power combination from the two antennas. If you're interested in how to get started, this article is a *must* read!

BTW, young Bob is *not* a ham but is "learning electronics and radio" as he goes along. From what the article says, he already knows more about antennas, coax, and the insides of a receiver than a great many hams.

II. Proceedings of the IEEE, Vol. 82, No. 5, May, 1994.

The entire issue is devoted to the subject of Radio Telescopes, and features a total of eighteen articles. (Contact IEEE at 445 Hoes Lane, P.O. Box 1331, Piscataway, NJ 08855-1331. Single issues of the Proceedings are available at $10.00 for IEEE members, $20.00 for non-members)

1314. FS: DSP-12 DSP modem

Newsgroup: rec.radio.amateur.space
Date: 1995-06-20 00:00:00 UTC
From: wroth@netcom.com
Message-ID: <wrothDAHwHt.JyB@netcom.com>
Source record: 24813
Cross-posted to: rec.radio.swap,rec.radio.amateur.space

I have for sale an LL Grace DSP-12 DSP Modem. The DSP-12 is well known for it's use on the digital pacsats. Modems include 9600 terrestrial/pacsat, 4800, 1200 for pacsat, 1200 for terrestrial packet, 300 packet hf, many rtty modes, ascii, ao-13 telemetry decode, ACARS (aircraft telemetry), a signal generator, digital voice recorder and more. There are three separate radio ports, with separate ptt, tx, rx etc. so you can switch from one radio to another via software. This is the only DSP modem with more than two ports. The DSP-12 is compatible with WISP, PB/PG, SatLink for use with the pacsats. It also has a KISS mode, and is TNC-2 compatible.

Included is the 1 meg memory option, cables, manuals and a complete DSP development kit to write and compile your own modems.
The latest firmware is installed.

The unit works great, in fact it is now, and has been, tracking all of the accessable digital amateur birds in orbit for the last couple of years. My reason for selling is to generate money to pay off debts from my new obsessions, photograhy and aviation.

I'm asking $550, which is about $250 less than my purchase price. I'll ship ground freight. You can contact me at 817-240-1430 evenings, or 214-454-1448 days. A message to WA2N@AMSAT.ORG, or on Compuserve at 73055,1733 will work as well.

The best way to get Shuttle elements, IMHO, is to subscribe to the Shuttle Elements Mailing List on the Internet. The list consolidates several different sources of elements for the shuttle and sends out only the most up to date information available.

To get more information about the list there is a new Web page that you can read at <ftp://ftp.cts.com/pub/garym/elements.html> that tells all about the list. If you don't have access to the Web, you can also get info by sending email to listserv@alsys.com with the text "info elements" as the first line in your mail message.

Message-ID: <93.4506.7587.0NFBA7A5@woodybbs.com>
Source record: 24576

I'm just getting into satellite operation. I've been on RS12 about one month with about a dozen contacts. I would like to try some of the other sats but only have 2M and 440 FM. Are there any converters that I can use on my HF or mobile (FM) rig? Other than purchasing a multi mode 2M 440 rig is there another way to get on these birds?

Also, what about antennas? Right now I'm on a G5RV or my Tri-bander (TA33Jr.). They work well on HF but I'm not sure of the best ant. to use for VHF/UHF op. I do have a 2M verticals I use with packet.

Thanks for reading this and any info would be appreciated.

Space Bulletin 008 ARLS008
From ARRL Headquarters
Newington, CT June 22, 1995
To all radio amateurs

SB SPACE ARL ARLS008
ARLS008 SAREX launch on Friday

The Space Shuttle Atlantis is scheduled to launch on Friday, June 23 at 2108 UTC. The mission, designated STS-71, carries the Shuttle Amateur Radio EXperiment or SAREX. Astronauts Ellen S. Baker and Charlie Precourt are both Amateur Radio operators. Ellen previously used ham radio from aboard the Shuttle Columbia during STS-50 in June 1992, and her call sign is KB5SIX. Charlie is KB5YSQ and also operated SAREX from Columbia during STS-55 in April 1993.

The crew has scheduled voice contacts with 4 school groups in the US and one in Russia. The crew plans to make random contacts with the Amateur Radio community as their busy schedules permit. Landing is planned for July 4 at the Kennedy Space Center in Florida.

The crew will operate 2 meter FM voice only, using a radio which will also facilitate a rendezvous and docking with the Russian Space Station Mir. The docking is planned to occur on Monday, June 26. The shuttle will carry two new Mir crew members (Mir 19) to the station, and return to Earth with the three Mir 18 crew members (Vladimir Dezhurov, Gennadiy Strekalov, and US astronaut Norm Thagard). This mission is the first of at least seven shuttle flights to Mir. The effort is a precursor to building the International Space Station.

Most of the SAREX activities are planned for after the Shuttle separates from Mir on July 1. The following Keplerian element set, JSC-008a, can be used to track the shuttle after the separation.

STS-71
1 99971U 95182.64126116 .00004001 00000-0 25599-3 0 86
2 99971 51.6471 85.3203 0005502 102.6430 257.5145 15.57450161 1230

Satellite: STS-71
Catalog number: 99971
Epoch time: 95182.64126116 = (01-Jul-95 15:23:24.96 UTC)

Element set: 008
Inclination: 51.6471 deg
RA of node: 85.3203 deg Space Shuttle Flight STS-71
Eccentricity: .0005502 Prelaunch element set JSC-008a
Arg of perigee: 102.6430 deg Launch: 23-Jun-95 21:08:37 UTC
Mean anomaly: 257.5145 deg
Mean motion: 15.57450161 rev/day Gil Carman
Decay rate: 4.001e-05 rev/day sq NASA Johnson Space Center
Epoch rev: 123
Checksum: 260

These elements are valid from post-separation on July 1 at 1449 UTC until the deorbit burn on July 4 at 1454 UTC. Thanks to Gil Carman, WA5NOM, at the NASA Johnson Space Center for the preceding element set.

A different set of frequencies will be used for this SAREX mission. The astronauts will operate split, transmitting and receiving on separate frequencies. Please do not transmit on the shuttles downlink frequency. The downlink is your receiving frequency. The uplink is your transmitting frequency. The FM voice downlink is 145.84 MHz. The FM voice uplinks are 144.45 and 144.47 MHz. The crew will not favor either uplink frequency, so your ability to communicate with SAREX will be the luck of the draw. To avoid causing interference to other stations transmit only when the shuttle is within range and when the SAREX station is on the air.

Send reports and QSLs to the ARRL Educational Activities Department. Include the mission number, date, time in UTC, frequency and mode in your report. You must also include a self-addressed stamped business-sized envelope if you wish to receive a card.

Cross-posted to: sci.space.tech,sci.space.shuttle,rec.radio.amateur.space

June 23, 1995

In view of tomorrow's launch of Space Shuttle Atlantis and its docking mission with the Russian Space Station Mir, the SatTrack (V3.1) software package is being announced again, especially now that it also compiles on DEC Alpha Servers with APX/OSF.

SatTrack is a satellite orbit prediction and realtime tracking program with X Window System color graphics, and shows a worldmap tracking display similar to the one in NASA's mission control center.

The program has been written in C language and runs on a number of different UNIX systems (Sun, HP, IBM, DEC, Linux, FreeBSD, NetBSD) with X11R5. For detailed on-line information check the SatTrack web page at:

http://ssl.berkeley.edu/isi_www/sattrack.html

The source code distribution file sattrack-3.1.tar.gz (or sattrack.V3.1.tar.gz) is also available from:

archive.afit.af.mil /pub/space
ftp.amsat.org /amsat/software/Linux

A NEW MAKEFILE FOR DEC ALPHAS WITH APX/OSF IS AVAILABLE FROM THE WEB PAGE!

If you do not have access to the web, send me a note and I'll email this Makefile to you. Replace the Makefile that comes with the V3.1 distribution with the new Makefile that also includes DEC machines.

>Which Houston repeater carries shuttle audio retransmissions?
>
>Tnx, Greg, KD4HZ

This list courtesy of a kind participant on rec.radiio.shortwave, where I asked
the same question recently. However, the STS-71 press kit(jun 95)
had some SW frequency changes for WA3NAN which I annotate below,
as well. WA3NAN is definitely where you want to listen for 24-hour
shuttle to Houston comms. In the local Greenbelt Maryland area WA3NAN
has in the past rebroadcast shuttle-to-Houston comms on SOMEWHERE
around 145+ Mhz (I just don't know the exact frequency, try 145.46 or 145.49
or 149.45 or something like that):

```

27065 NASA CB radios (CB channel 9)

NOTE: Most stations use USB, but for some reason I have heard
NASA using LSB on 20198 KHZ.

WA3NAN at the Goddard Space Flight Center in Greenbelt Maryland
rebroadcasts Space Shuttle Audio on the following frequencies.

3860 lsb, 7185 lsb, 14295 usb, and 20395 KHZ usb.

[According to STS-71 press kit, June 95:

The Goddard Space Flight Center amateur radio club planned HF
operating frequencies:
3.860 MHz 7.185 MHz
14.295 21.395
28.650]

This list was compiled thanks to information from Monitoring Times
magazine, the Ontario DX Assocation, the South African SWL Club
and personal monitoring.
I am trying to keep this list as up to date as possible, therefore
if you have any corrections or additions, they would be
most welcome.

Good listening,
Paul Blanchard

There is a decription in Chap 8 of _The Satellite Experimenter's Handbook_, published by ARRL (1992). One person in sci.geo.satellite-nav reported cobbling one up - and it worked. I'm cobbling my own together now - very slowly. The cited applications are for GPS.

Quadrifilar Helix, ay...

What does that buy you over a regular helix?
3dB gain?

Is a regular helix monofilar or bifilar?

73 de somewhat startled WB4U
Ken

1336. Re: Quadrifilar Helix (ulp!)

Newsgroup: rec.radio.amateur.space

Source record: 24593

Ken, The QHA gets you a circular polarized signal over the entire hemisphere. This is very useful for NOAA Polar Orbiting Satellites.

It's the type of antenna used in handheld GPS units also.

Hope this helps.

1337. Two-Line Orbital Element Sets (TLE628)

Newsgroup: rec.radio.amateur.space
Date: 1995-06-24 00:00:00 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.803952489@dolphin>
Source record: 24594

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (334) 409-9280, and are updated daily (when possible). Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at speeds up to 14,400 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily) and some documentation and software are available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space.news and rec.radio.amateur.space. This week's elements are provided below.

Thanks for the pointers...I got on the shuttle mailing list, and even
got the first elements (pre-launch). I also have STSPLUS up and running...
NICE PROGRAM!

Quadrifilar Helix is an opt antenna where cicular polarization is required and omnidirectional too.
It's hard to realize, or bettere, to adjust even with high expensive instrumentation, for home made contruction I'll suggest you the Lindenblad antenna, thats ok for LEO bird.

Regular helix is monofilar.

Hope this help

I'm looking into getting a AEA pk232MBX, but since i got info from aea about
their products i'm not sure which is better for pacsat's?
do i need a PSK satellite modem <dsp2232> or can i use a regular
packet modem <pk232>? i AM looking for a multi-Mode system

PLEASE HELP!

Depending on how many modes you want to use ...

To work the 1200 pacsats, you will need a 1200 PSK modem to add on to the pk232 (I believe this requires adding a modem disc. header (TAPR has a kit)). Ditto for the 9600 bps FSK satellites.

Once you add all this up, and any other modes you want, the DSP-2232 may start to become cost-effective. I use a DSP-2232 a lot in a variety of modes, both satellite and terrestrial.

1343. GOES

1691 MHz. The polar orbiters (NOAA and Russian Meteor) use
frequencies between 137.5 and 137.85 MHz, depending on which bird it is.
The NOAAs also use 1701 MHz for the high-resolution (HRPT) imagery.

1345. Non expensive PACSAT operation ?

Newsgroup: rec.radio.amateur.space
Date: 1995-06-26 00:00:00 UTC
From: Peter@hfk.e-technik.uni-kassel.de
Message-ID: <3sm1j0$pto@hrz-ws11.hrz.uni-kassel.de>
Source record: 24602

Hi ,

For quite a while I have been interested in PACSAT operation (9600Bd)
I posess allmost everything to begin PACSAT reception but a 70 cm
transceiver . My problem now is : Do I Need to make doppler correction
in FM , that is : does my transceiver NEED small steps in FM ???

Most of the PACSAT operators seem to use FT736 or TS790 etc .
To me these TRXs seem way too expensive to just use them for PACSATs.
I am thinking about byuing a TR851 or the Yaesu 790RII , will I be
able to use them for PACSATS ?? (9600 FSK , FM ?)

Is there an alternative like building a TRX only to be used for
PACSAT?

TNX in advance ,
Peter

ps : not sure wether it was PACSATS or MICROSATS ... But 9600 BD like
KO23 and KO25 etc.

>do i need a PSK satellite modem <dsp2232> or can i use a regular
>packet modem <pk232>? i AM looking for a multi-Mode system
>
>PLEASE HELP!

The PK-232 will NOT do pacsats, either 1200 baud psk or 9600 fsk. If you intend to do satellite packet ever, don't waste your money on the PK-232, save up and get the DSP-2232. It does everything the PK-232 does and more.

I have been trying to find WWW pages concerning the specifications of satellites and the technology used to create them. Example would be the tx power, antenna array, power supply requirements and how they were met etc etc..

I have still not been able to locate such information and wonder if anyone can help me in this matter,

Cheers,

1348. RS10 Questions

Newsgroup: rec.radio.amateur.space
Date: 1995-06-27 00:00:00 UTC
From: mellerso@uga.cc.uga.edu
Message-ID: <mellerso.80.0041C8BC@uga.cc.uga.edu>
Source record: 24605

I have a couple of simple questions about working RS10.

I am using an Icom 728 with a Butternut vertical for the downlink which appears to work fine. My uplink is a Kenwwod TR9000 running 10Watts into a vertically polarized beam. I get a pretty decent signal into the sat using CW for a large portion of the pass. However, when I go to USB for voice, the signal sounds kind of weak and distorted. The TR9000 seems to be working fine, so is this an antenna or a power related problem ?

I also have been somewhat confused as to the proper method for opearating the Sats. I notice that some operators are staying on the same downlink frequency while adjusting the uplink frequency to compensate for doppler. I thought you are supposed to stay on the same uplink and adjust the downlink to compensate for doppler so you would not run over someone elses signal ?

Thanks

Check the rig with another station on 2m ssb to make sure there's not
an RF problem. If it's clean "simplex", it's likely that power is the
issue (maybe too much, maybe too little - experiment).

Keep your downlink (10m) signal on the same frequency by adjusting
your transmitter to compensate for doppler. That way, you won't run
over other users on the bird.

>Thanks

Hope to see you there soon!

I've heard shuttle audio on two different 2-meter repeaters:

TRW: 145.320 (-)
JPL: 147.150 (+)

Usually the repeater still functions normally, with the shuttle
feed being heard during idle periods.

ARLS009 Shuttle carries two hams

Launch of the Space Shuttle Atlantis occurred on Friday, June 27,
1995 at 1932 UTC. The mission, designated STS-71, carries the
Shuttle Amateur Radio EXperiment or SAREX. Amateur Radio-licensed
astronauts Ellen S. Baker, KB5SIX and Charlie Precourt, KB5YSQ will
operate a 2-meter FM voice radio to make contacts with amateurs and
student groups. This same radio will also facilitate a rendezvous
and docking with the Russian Space Station Mir. Docking will occur
approximately 2 days after launch, and separation is scheduled
approximately 7 days after launch. Most SAREX activities are
planned for after the shuttle and space station separate. Keep
posted to W1AW for possible operating times and Keplerian elements.

Try using the Alliance U110. I have been using one for awhile now. I also
can tell you an easy way to get accurate reliable position feedback.
Usually these can be had at hamfests for less than ten bucks.
The newer the better.

>
>> thanks
>
> Yer Welkum. :-)

i just got a txt file from sci.space.news and another txt from somewhere else, and they both have the FREQ at 137.xx. Yes i do believe you, but out of 2 places i am still not sure WHY they say it is 137mhz

thanks anyhow

LO-19 crashed some time around Su 18/6 midday UTC. It is back on the
air, transmitting MBL telemetry, and beacons periodically. Signals
appear to be down somewhat. See SpaceNews of 26/6 for further details.
AO-16 is open as per normal, with good signals and lots of activity,
carrying the South American forwarding whilst LO-19 is QRT.

1365. Shuttle Retransmission FAQ

Newsgroup: rec.radio.amateur.space
Date: 1995-06-28 00:00:00 UTC
From: hrsblackwell@stars.gsfc.nasa.gov
Message-ID: <hrsblackwell-2806951621540001@dimsdale.gsfc.nasa.gov>
Source record: 24622

Greetings,

This is an attempt to answer some commonly asked questions about the Goddard Amateur Radio Club's Shuttle Retransmission Activity. It was composed of bits and pieces of other documents as well as some new information. Unfortunately, I have lost some of the references to other authors who have contributed to this document. If you see something in this document that looks familiar, please let me know so I can give you credit for it.

This document is really a first draft and I expect it will expand. It can also be found on GARC's WWW server

URL: http://garc.gsfc.nasa.gov/www/garc-home-page.html

under Shuttle Retransmission.

Please send any comments or other questions to

jim.blackwell@gsfc.nasa.gov

I will try to answer them.

73

Jim Blackwell, N3KWU
Past President, Goddard Amateur Radio Club, Inc.

Shuttle Retransmission Fact Sheet
by Jim Blackwell, N3KWU
Last Update 06/21/95

I. History

Kindled by a desire to spread the excitement of America's space program and of the Space Shuttle in particular, members of the Goddard Amateur Radio Club (WA3NAN) and the Amateur Satellite Corporation (AMSAT) devised a plan to re-transmit live, air-to-ground audio over amateur frequencies.

After overcoming many hurdles, the Shuttle Retransmission effort began on August 31, 1983, 7 hours prior to the launch of Challenger on mission STS-8 on the local AMSAT/GARC 2 meter repeater by virtue of a waiver granted by the FCC for this purpose.

Retransmissions expanded to HF frequencies with the launch of STS-9 on November 28, 1983. Among many firsts for the Shuttle program during this mission was the first use of amateur radio from space by Payload Specialist Owen Garriott, W5LFL.

The success of this effort is shared by NASA, the Goddard Space Flight Center, AMSAT, hundreds of dedicated volunteer control operators, and by the world-wide support of the Amateur Community.

II. Frequencies

Retransmission of Shuttle air-to-ground audio from WA3NAN may be heard on the following frequencies:

Frequency (MHz)	Mode	Antennas
3.860	SSB LSB	N-S/E-W Dipoles
7.185	SSB LSB	N-S/E-W Dipoles
14.295	SSB USB	3-element Yagi
21.395	SSB USB	5-element Yagi
28.650	SSB USB	4-element Yagi
147.45	FM Simplex	Phased vertical

Where SSB is Single-Side-Band and LSB, USB indicate either Lower and Upper Side Band. A short-wave receiver possessing a Beat Frequency Oscillator (BFO) is needed to receive these transmissions.

III. Frequently Asked Questions About Shuttle Retransmissions

1. When Are You On The Air ?---There are several criteria that best determine when you will be able to receive Shuttle Retransmissions (not necessarily in order of priority):

A. While The Crew Is Awake---We are usually on the air from the time the crew gets its wakeup call (assuming the mission is not of the 24 hour variety) till the time they go into what is called "Pre-Sleep".

B. When Volunteer Operators Are Available---We have a limited pool of operators available during any single mission. The most difficult days and nights to schedule are usually on the weekends.

C. When Local Weather Permits---We are located in Greenbelt, MD just outside Washington DC. If you do not hear us and have the means to do so, check our current local weather. If there are thunderstorms (or other inclement weather such as a recent snowfall) currently in the area or predicted, we will likely be off the air until such weather has passed.

D. When Equipment Is Operational---Given the nature of our equipment, we typically have at least one major failure during a mission. Though we strive to get the failed equipment back on-line as soon as possible there will be downtimes for all bands.

2. How Soon Before Launch Do You Go On The Air?---We usually begin retransmissions about 1 hour before the predicted launch time.

3. Does Anyone Get Paid To Do This?---No. This is purely a voluntary activity by our membership as a public service to all Radio Amateurs.

4. What Is NASA's Involvement With The Club?---The Goddard Amateur Radio Club is one of many employee clubs sanctioned by the Goddard Employee Welfare Association (GEWA).

5. Your Shuttle Retransmissions Are Interfering With My Net...---We apologize and try to accommodate other Amateur Radio activities that our retransmissions may interfere with. This decision is usually made by the Control Operator on duty and/or the Shuttle Retransmission Director. The club leadership may also consider requests made , in writing, by groups or individual Radio Amateurs.

6. Why Do Other Hams Interfere With Shuttle Retransmissions---Contrary to popular belief, Radio Amateurs share the frequencies we are allotted by the FCC and our license class. All are free to use the frequencies whenever they want and may not even realize that they are on top of our signal. During missions, we ID the station frequently to let others know that the frequency is in use.

7. I Do Not Hear You In Anytown, Planet Earth, But I Know You Must Be On The Air, Why?---If you know that we are on the air and you cannot receive our signal and the problem is not with your equipment (receiver and antenna), then it is likely that signal propagation is not good for your geographic location.. Good propagation depends on a number of factors and varies with solar cycle (and storms), time of day, some atmospheric conditions, whether the given frequencies "skip zone" is such that the signal even reaches your location, and what direction and power we are transmitting. We welcome propagation reports since it tells us if it is indeed propagation, or that perhaps it is an antenna or transmitter problem at the station.

8. I Want To Send A Signal Report---You can send us a signal report to the addresses listed under "Contact Information". Please include a Self-Addressed Stamped Envelope (SASE) with appropriate postage if you wish to receive confirmation of your report (we use the QSL bureaus for requests made outside the US). Note that postage comes out of the club budget.

9. How Can I Get NASA TV---NASA Television offers the general public a front-row seat at mission launches and activities taking place in space during a mission, as well as informational and educational programming, historical documentaries, and updates on the latest developments in aeronautics and space science. NASA TV occasionally airs live coverage of SAREX activities. Programming is received by satellite dish or may be available through your local cable television network. NASA TV can be received from: Spacenet 2, Transponder--5, Channel--9, located at 69 degrees west longitude, at a frequency of 3880.0 MHz (C-band) with horizontal polarization (audio on 6.8 MHz).

For more information, contact: Technology and Evaluation Branch, Education Division, Code FET, NASA Headquarters, Washington D.C. 20546, or call (202) 358-1540.

10. Can I Retransmit Communications Between The Space Shuttle And Mission Control On Amateur Frequencies?---The FCC rules indicate that amateur stations are permitted to retransmit Space Shuttle air-to-ground

communications, provided that approval has been obtained from NASA (FCC Rules, Part 97.113 (e)).

In 1990, ARRL sought permission from NASA, on behalf of radio amateurs, to retransmit shuttle communications. The response from NASA's Office of Public Affairs encouraged such retransmissions, and indicated that the audio is public domain.

If you plan to rebroadcast NASA Shuttle audio, please follow these guidelines:

A. In keeping with good amateur practice and the FCC rules, shuttle audio retransmissions should be limited to missions of a specific educational purpose (non-commercial), such as those carrying the SAREX payload.

B. Retransmissions should be done manually (with a control operator present).

C. Occasionally, NASA audio may contain music. Amateurs should avoid, if at all possible, retransmitting music or any other prohibited transmissions not permitted by the FCC rules (FCC Rules, Part 97.113).

Please note however that the Shuttle audio retransmitted by GARC is not what one can receive from NASA TV. Rather, we get a direct feed from NASCOM. The difference is that this audio feed does not contain other coverage such as press briefings and mission status reports. This is significant because of restrictions on what are considered "permissible" transmissions by the FCC (see item C. above).

11. I Want NASA Goodies, Where Can I Get Them?---By "goodies" I refer to patches, photos, information related to the Space program, NASA centers, GSFC, projects and so on. Rather than send such requests to GARC, we prefer that you send your queries to the GSFC Visitor's Center at:

GSFC Visitor's Center
Code 130.0
NASA Goddard Space Flight Center, Greenbelt MD 20771

12. Can I Become A Member?---Membership is presently limited to GSFC Civil Servant and Contractor employees and their immediate families. We do extend membership to those outside GSFC provided they assist us with our public service activities including Shuttle Retransmission. We are working to allow other levels of membership to include a "Contributing Membership" that would allow interested individuals to receive our monthly newsletter and help to offset the cost of our activities.

IV. Contact Information

You can contact the Goddard Amateur Radio Club at the following address:

Goddard ARC/WA3NAN
P.O. Box 86

Greenbelt, MD 20768-0086
(301) 286-6673 (during missions)

V. WA3NAN Club BBS

The Goddard Amateur Radio Club, Inc. maintains a Bulletin Board System (BBS) which is accessible by way of the Internet, modem and packet radio. The BBS contains areas with information on the club, mail distributed by the Amateur Satellite Corporation BB (AMSAT-BB) listserver, SAREX bulletins and Space Shuttle mission information. During Shuttle missions, users can also access Keplerian Orbital Elements (Keps) which are generated by the club based on information generated by NASCOM at GSFC (these orbital elements are read over-the-air by our volunteer operators).

The BBS is accessible by the following means:

1. Internet: telnet to wa3nan.gsfc.nasa.gov (128.183.105.17)
2. Telephone: (301) 286-4137 (up to 14.4 kbaud supported)
3. Packet Radio: WA3NAN on 145.090 MHz in DC area.

Just follow the login instructions. Note: Full access to the BBS is limited to members of the club.

VI. GARC World Wide Web (WWW) Server

The Goddard Amateur Radio Club, Inc. maintains a WWW Server containing a wide variety of information about the club, its activities, as well as links to other Amateur Radio resources. To access this server, you must have an Internet connection and a WWW browser such as NCSA Mosaic, Netscape Communications Corporation NetScape Navigator, or the text-based Lynx. The URL address is:

http://garc.gsfc.nasa.gov/www/garc-home-page.html

It's not all that tough, Take your best guess at the satellites element set
(position,velocity,etc is easiest) and calculate the expected doppler.
compare the expected and measured dopplers and 'correct' the elements
(aka state vector) to reduce the error. The vector of derivatives of the
states with respect to the observable is how the error is used. All sorts
of fun stuff is also done with the weighting and error estimation.

Hope this helps.

Date: 1995-06-28 00:00:00 UTC
From: mfn@astral.magic.ca
Message-ID: <mfn-2806951439570001@pm1pool1.magic.ca>
Source record: 24629

Greetings.

I've heard that it's often possible to see Mir as it comes over the horizon in early mornings. It must follow then that once Atlantis is coupled with the Mir station, it would be possible to see both craft.

Can anyone tell me how I might go about 'finding' the craft in the sky, if in fact it's even possible. I'm located in Toronto, ON.

Thanks much.

1373. Re: RS10 Questions

Newsgroup: rec.radio.amateur.space
Date: 1995-06-29 00:00:00 UTC
From: n7tcf@primenet.com
Message-ID: <3sthpu$9ou@nnrp1.primenet.com>
Source record: 24630

I worked RS10 on verticals for my first year.
Signals are higly varible, depending what sort of pass you are seeing. I built a JFET preamp that helped bring the signal up a little. You will still have complete fades, 29 MHz is subject to Faraday rotation, not to mention the random polarized sat signal.
Always tune your transmit signal. Everybody hears the downlink at the same point on the dial. By tuning the transmit, will not step on anybody, unless they are local.
10 watts is ok. RS10 has an AGC system. One loud signal will shut-down the reciever. The loud-mouthed operator will wonder why nobody answers him.
As for distortion, if the signals from the bird sound clean, then check your equipment. RS10 is a linear transponder, whatever goes in, comes out the same.
Good luck and 73

Jim

1374. Two-Line Orbital Element Set: Space Shuttle

Newsgroup: rec.radio.amateur.space

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (334) 409-9280, and are updated daily (when possible). Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current elements for the current shuttle mission are provided below. The Celestial BBS may be accessed 24 hours/day at speeds up to 14,400 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily), shuttle elements, and some documentation and software are also available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

From: Terry Fugate <tfugate@uklans.uky.edu>
Message-ID: <3sudrn$lha@service1.uky.edu>
Source record: 24634

Thereare several different routes to go.
Currently I am using JVFAX 7.0 with a simple opamp hf fax adaptor. The
software includes plans for a real simple VCO front end to convert the
NOAA AM FAX signal into an FM fax signal. It works pretty good.
There is also a program called SBDSP(.ZIP) that allows you to feed the
audio from your receiver into a SOUND BLASTER and convert the recorded
WAV or VOC file into an APT image. This sounds like a good method, but
I have yet to display the resultant image. There is a BBS in dallas tx
ran by The Dallas Remote Imaging Group(DRIG) that has lots of sat weather
software. I don't have the phone number handy but if you need it I will
post it here. They only offer internet access to members that have paid
something like $75. APTCAP$(.zip) is supposed to allow you to view the
image created by SBDSP, but again I've not had much luck.
JVFAX 7.0 and SBDSP should be at the oakland simtel ftp site
the APTCAPO.zip should be at the AMSAT Home page ftp site.

If you are willing to shell out "real" money there are several
"comercial" systems to receive wx sat stuff. If you need I have several
addresses but I can only speak with knowledge on the JVFAX, SPDSP,
aptcap40. I have posted a question over in rec.amateur.homebrew so I
might have more information later.

n7tcf@primenet.com wrote:

>Always tune your transmit signal. Everybody hears
>the downlink at the same point on the dial.

Not quite precisely true (if the satellite is approaching me, all the downlink signals will be higher in frequency than for someone who has the satellite receding from him.) But in *relative* terms, all the signals in the downlink will have the same relationship to one another, no matter where you are. But your main point is correct. To keep from "drifting" on top of someone else due to uplink doppler, you should keep adjusting your uplink frequency.

The problem I kept having during FD is this: if the other guy was transmitting for more than a few seconds, and the sat was near maximum elevation, the doppler would have moved my signal right out of my receiver passband while he was transmitting! So I have to frantically swish to try to find myself when it's my turn to transmit. Meanwhile he has started to call me again. I guess it's a matter of practice. I've gotten used to RS-12, where doppler is such a minor problem because of the lower frequencies, that it is usually ignored.

ARLS008 SAREX launch on Friday

ZCZC AS87
QST de W1AW
Space Bulletin 008 ARLS008
From ARRL Headquarters
Newington, CT June 22, 1995
To all radio amateurs

SB SPACE ARL ARLS008
ARLS008 SAREX launch on Friday

The Space Shuttle Atlantis is scheduled to launch on Friday, June 23
at 2108 UTC. The mission, designated STS-71, carries the Shuttle
Amateur Radio EXperiment or SAREX. Astronauts Ellen S. Baker and
Charlie Precourt are both Amateur Radio operators. Ellen previously
used ham radio from aboard the Shuttle Columbia during STS-50 in
June 1992, and her call sign is KB5SIX. Charlie is KB5YSQ and also
operated SAREX from Columbia during STS-55 in April 1993.

The crew has scheduled voice contacts with 4 school groups in the US
and one in Russia. The crew plans to make random contacts with the
Amateur Radio community as their busy schedules permit. Landing is
planned for July 4 at the Kennedy Space Center in Florida.

The crew will operate 2 meter FM voice only, using a radio which will also facilitate a rendezvous and docking with the Russian Space Station Mir. The docking is planned to occur on Monday, June 26. The shuttle will carry two new Mir crew members (Mir 19) to the station, and return to Earth with the three Mir 18 crew members (Vladimir Dezhurov, Gennadiy Strekalov, and US astronaut Norm Thagard). This mission is the first of at least seven shuttle flights to Mir. The effort is a precursor to building the International Space Station.

Most of the SAREX activities are planned for after the Shuttle separates from Mir on July 1. The following Keplerian element set, JSC-008a, can be used to track the shuttle after the separation.

STS-71
1 99971U 95182.64126116 .00004001 00000-0 25599-3 0 86
2 99971 51.6471 85.3203 0005502 102.6430 257.5145 15.57450161 1230

Satellite: STS-71
Catalog number: 99971
Epoch time: 95182.64126116 = (01-Jul-95 15:23:24.96 UTC)
Element set: 008
Inclination: 51.6471 deg
RA of node: 85.3203 deg Space Shuttle Flight STS-71
Eccentricity: .0005502 Prelaunch element set JSC-008a
Arg of perigee: 102.6430 deg Launch: 23-Jun-95 21:08:37 UTC
Mean anomaly: 257.5145 deg
Mean motion: 15.57450161 rev/day Gil Carman
Decay rate: 4.001e-05 rev/day sq NASA Johnson Space Center
Epoch rev: 123
Checksum: 260

These elements are valid from post-separation on July 1 at 1449 UTC until the deorbit burn on July 4 at 1454 UTC. Thanks to Gil Carman, WA5NOM, at the NASA Johnson Space Center for the preceding element set.

A different set of frequencies will be used for this SAREX mission. The astronauts will operate split, transmitting and receiving on separate frequencies. Please do not transmit on the shuttles downlink frequency. The downlink is your receiving frequency. The uplink is your transmitting frequency. The FM voice downlink is 145.84 MHz. The FM voice uplinks are 144.45 and 144.47 MHz. The crew will not favor either uplink frequency, so your ability to communicate with SAREX will be the luck of the draw. To avoid causing interference to other stations transmit only when the shuttle is within range and when the SAREX station is on the air.

Send reports and QSLs to the ARRL Educational Activities Department. Include the mission number, date, time in UTC, frequency and mode in your report. You must also include a self-addressed stamped business-sized envelope if you wish to receive a card.
NNNN
/EX

1382. Re: RS10 Questions

Newsgroup: rec.radio.amateur.space
Date: 1995-06-29 00:00:00 UTC
From: greg@core.rose.hp.com
Message-ID: <DAyK16.E9I@icon.rose.hp.com>
Source record: 24639

Mike Ellerson (mellerso@uga.cc.uga.edu) wrote:
: I have a couple of simple questions about working RS10.
:
: I am using an Icom 728 with a Butternut vertical for the downlink which
: appears to work fine. My uplink is a Kenwwod TR9000 running 10Watts into a
: vertically polarized beam. I get a pretty decent signal into the sat using CW
: for a large portion of the pass. However, when I go to USB for voice, the
: signal sounds kind of weak and distorted. The TR9000 seems to be working fine,
: so is this an antenna or a power related problem ?

How big is the beam? 10 watts, minus feed cable and such, is a little marginal
on RS-10 these days for SSB. Depending on conditions and how busy the bird
is, I have found 10 watts into a J-pole is sometimes all I need. Other times,
I need 50 watts into my 5 element beam. Try a late night pass when few are
on, and see if it improves.

:
: I also have been somewhat confused as to the proper method for opearating the
: Sats. I notice that some operators are staying on the same downlink frequency
: while adjusting the uplink frequency to compensate for doppler. I thought you
: are supposed to stay on the same uplink and adjust the downlink to compensate
: for doppler so you would not run over someone elses signal ?
:

The idea is to move the higher frequency knob. For RS-10 that's the 2 meter
uplink. For other satelites, it might be the downlink (e.g. FO-20 mode JA).

Greg.

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (334) 409-9280, and are updated daily (when possible). Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current elements for the current shuttle mission are provided below. The Celestial BBS may be accessed 24 hours/day at speeds up to 14,400 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily), shuttle elements, and some documentation and software are also available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

1388. shuttle repeaters in the UK

Newsgroup: rec.radio.amateur.space
Date: 1995-06-30 00:00:00 UTC
From: "V.Tandy" <asx008@coventry.ac.uk>
Message-ID: <Pine.ULT.3.91.950630164824.3465B-100000@rowan>
Source record: 24645

I have a good scanner, but only the simple telescopic aerial that came with it. As you can tell I am very much a beginner but I am interested in listening to the shuttle communications. Are there any repeaters in the United Kingdom which I might receive, I am right in the center of the country. Does the shuttle pass anywhere near the UK at any time so that I might get them directly?

I would be interested in any comments

Thanks

Vic

1389. Packet to internet gateway

They appear different for a couple of reasons. The one that I am sure of is that they are calculated with date codes some 7 hours different. The one that I am less sure of is that the Mir orbits are started from a north passing of the equator and the Shuttle orbits are started from a north passing of KSC latitude. The joy of KEPs is that they end up in the same place.

>
Hopefully I can clear your confusion....

As I understand it the Geostationary WXSAT's transmit WEFAX (AM
fax) and PDUS (digital data) at S-band freqs only.

The 137 MHz bit comes into the picture because most amateur WXSAT
ers use a downconverter from S-band to VHF 137MHz to receive the
WEFAX data (which is exactly the same format as the NOAA polar
orbiters) they can then decode the picture in the same manner as
the polar orbiters (which transmit APT at 137MHz) without the cost
of an S-band receiver.

hope this helps

Has anyone compiled a frequency list for the amateur satellites recently?
The latest I've been able to come across was put together back in 1993,
so if anyone has a later one please post it. I'm sure I'm not the only
one that needs an update every few years or so! :)
tnx in advance.

1393. Anyone willing to loan an alt/az rotator to Hudson schools for a few days?

Newsgroup: rec.radio.amateur.space
Date: 1995-06-30 00:00:00 UTC
From: "Carl D. Howe" <chowe@bbnplanet.com>
Message-ID: <3t1ql6$cdn@mercury.near.net>
Source record: 24650

Hi all,

My radio club (the Acton Boxboro Amateur Radio Club) is assisting a school in our area (the Hudson Forest St. School) in contacting STS-71. This school was selected as one of the five schools to make shuttle contacts on this mission, and the students there are very excited about it. As you may or may not know, the co-pilot of Atlantis went to school in Hudson, MA, and this is the opportunity a lifetime for many of the students at this school to talk to him.

We've had bought and planned to use an eggbeater 2 m antenna to talk to the shuttle (hams in this area have used that type of configuration successfully with the shuttle previously), but NASA has informed us that we must use an alt/azimuth tracking yagi because of the antenna configuration on this mission. We've found an appropriate 14 el yagi, but we don't have an alt/azimuth rotator (for Oscar 13, you can use armstrong rotation quite effectively!).

Does anyone in the western Boston suburbs have a working alt/azimuth rotator (preferrably with IBM PC control box) available that they'd be willing to loan us for a few days? The mission is scheduled for 5 July, and unless we can upgrade the antenna configuration to the yagi, the sched for the kids in Hudson may get scrubbed.

If anyone would be willing to help us out, please contact Gordon Dirk (KA1DWX) at (508) 263 1066, or me, Carl Howe (WG1V) at chowe@bbnplanet.com or phone me at (508) 897 4723.

Thanks in advance and 73,
Carl Howe, WG1V
Club Secretary

well, unless you have a good telescope, and a tracker, all you will see is a
bright point of light shooting across the sky. even still, it's a lovely
sight!!

1397. Shuttle/Mir Visible Tonight! (Saturday July 1st)

Newsgroup: rec.radio.amateur.space
Date: 1995-07-01 00:00:00 UTC
From: garym@alsys.com
Message-ID: <DB1t29.B1B@thomsoft.com>
Source record: 24654
Cross-posted to: sdnet.general,sdnet.events,cts.misc,rec.radio.amateur.space

The Shuttle Atlantis docked with the Mir Space Station will be visible to the naked eye in the San Diego area tonight (Saturday, July 1st) at about 9:14 PM in the Northwest sky. Last nights visible pass was easily seen and tonights visible pass should last longer and be even better.

When/Where

The Shuttle/Mir will come over the Northwest horizon at 9:11 PM PDT tonight. However, it will not be visible until it reaches an elevation (angle above the horizon) of about 20 degrees (depending upon your viewing location) which will occur at about 9:14 PM. It will reach peak elevation of 47 degrees at about 9:16 PM in the Northern (NNE) sky. Then it will descend towards the East and disappear into the Earth's shadow at about 9:17:40 PM. It will continue to descend in darkness, visible only to telescopes, until it crosses the Southeast horizon at 9:21 PM.

How to Look

During this pass of the Shuttle/Mir, they will be in sunlight while we are in darkness. This gives us a brightly lit satellite and makes it possible for us to see it. As they pass overhead they cross into the Earth's shadow and will fade out from view.

Start your search with the Big Dipper (Ursa Major) in the Northwest sky. If you make an imaginary line from the end of the Big Dipper (where it pours from) to the horizon, the Shuttle/Mir will first be visible about halfway up, and a little to the right of that line.

The Shuttle/Mir will look like a bright star moving across the sky. Sometimes you see Airplanes in the sky, these have colored and/or flashing lights on them. Satellites shine with a steady white light like a star. Tonight the Shuttle/Mir combination may be as bright as one of the planets like Venus or Jupiter.

The best place to view is one that gives you a clear view of the sky with no lights around. Go to a nearby park or the beach away from city lights if you live in the city. Binoculars can be used, but find it with the naked eye first. It moves across the sky too fast for telescopes to be used.

The Numbers

Time PDT			Az	El	Range	Height	Satellite	
MM	DD	YY	HHMM:SS	Deg	Deg	Km	Km	Visibility	Comments

In article <DB1ww3.J4@dorsai.org>, n2lak@news.dorsai.org (Dave Hines) says:
>
>Haven't heard a thing yet - maybe I'm going deaf......
>As of 1900 UTC 7/1/95.

According to an earlier article on the newsgroup:

Quote:
Most of the SAREX activities are planned for after the Shuttle
separates from Mir on July 1. The following Keplerian element set,
JSC-008a, can be used to track the shuttle after the separation.
Unquote.

The July 1 date was based on the earlier scheduled June 23 launch. So
adjust the date accordingly.

I hear we're going to get an "eyeball" tonight (Sat) in the mid Atlantic states.
Check in on the local news. I think I remember hearing somewhere between 9 and
10PM local. But Davids right, you'll just see a fast moving "star".

Mir and Atlantis had different TLEs at this time (late 27 June UTC)
because their rendezvous was still in progress. The mean motion and
eccentricity differences equate to heights of apogee and perigee (Ha x
Hp) of 218.2 x 208.6 nm for Mir; 210.5 x 159.4 nm for Atlantis. Over the
next 30 hours or so, Atlantis raised her orbit with no less than 3 major
burns and a buncha course corrections. She was barely off the pad and in
orbit when the above TLE was posted for Orbit 2.

Shhh! You just revealed the secret that NASA's been trying to hide -
that the docking didn't actually happen and they're actually faking the
entire thing in a warehouse in Nevada.

How do I know? A space alien told me!

I started NOAA/Meteor APT reception from a kitset demodulator attached to a handhled scanner. It worked find but does not have the bells and whistles that others may have. It is very simple to construct. Comes with the required software. You would also need an appropriate VHF pre-amp.

The kitset was featured in Electronics Australia in three parts June, July and August 1992. It was designed and sold directly by Tom Moffat (VK7TM). He has subsequently modified his software to receive geostationary pictures too. He was, in 1992, selling them for Australian $99 (plus postage outside Australia and New Zealand). He does not sell the pre-amp though.

You may like to write to him to find out the present price. His address is

Tom Moffat
High-Tech Tasmania
39 Pillinger Drive
Fern Tree
Tasmania 7054
Australia

For your information, his third article featured the Lindenblad antenna constructed out of 300 Ohms ribbon TV cables. It is very easy to construct and very cheap.
I am still using this antenna - very effective and economical.

Contact me if you have any further queries.

The Nienberge Amateur Radio Group (N46 of DARC) will launch an ARTOB this sunday.

Location: Sch&#65533;ppinger Berg (NW Germany) JO32PC
Date: Sunday, 07-02-95
Time: 12:00 UTC (Launch)
Drifting direction: probably to W/SW

The balloon:
Call sign: DL0ART/am
QRGs: 145.200 MHz: data and call sign in cw;
also downlink when switched to repeater mode
29 MHz: uplink when switched to repeater mode; if so,
the exact frequency will be broadcasted on 145.200
Mode: FM
ground teams: talk back on DB0EG (R71),
later on DB0PD (R84)

This will probably be a 2 or 3 h flight.

Any response and or reception reports will be highly appreciated. You may use the talk back frequencies for (short) reports (coordinator is DL3YBQ), or send a QSL card to DL9QJ via the buro. Any participation in using the repeater (if working) is also welcome, but please: use your ham spirit...

The N46-ARTOB team is looking forward to all responses, suggestions and especially reports.

I am aware that this information will only concern to hams living in the northern part of Germany or in the Netherlands, but maybe the balloon's sigs will be heard in even more distant places...
Please forward this message to any ham who might be interested!

For more information, please contact Oliver, DL9QJ (see below).

I'm sorry that this message is posted only abt 40 h before the launch, but that is the time when we decide about it.

Best 73, Oliver

SAREX is sponsored by NASA, ARRL, and AMSAT, with AMSAT taking responsibility for making sure that selected schools are technically ready for their contact with the astronauts. There are about 10 volunteers that are assigned as technical mentors to follow the progress of the school preparations. I'm the AMSAT appointed mentor for the Forest Avenue School. The new antenna equipment is being installed at the school now, but I wanted to explain to people why an omni-directional antenna is inadequate for school SAREX contacts.

As of STS-45, about half of school contacts "succeeded" on the first attempt 8(Success is defined as asking a single question and getting an intelligible reply. This is an incredible disappointment for the students involved who often spend months preparing for a contact. Because the majority of these missed contacts were due to operations errors or a marginal station at the school, AMSAT established the technical mentor program, established a telebridge network of amateur ground stations to allow SAREX contacts by schools with meager technical resources, and mandated OSCAR class ground stations at schools that would attempt direct contacts. With these changes the initial contact success rate has gone up to better than 90%. (There is usually one school per mission that has to reschedule a contact.)

Amateurs have trained ears, and we can pick an answer out when the average "civilian" can't even tell a voice is there. Add the noises inherent with a public address system and a crowd and you have a situation where you need a VERY clear signal. An omni-directional antenna is fine for the average random-QSO SAREX contact, but it is totally inadequate for a primary station. Omni-directional antennas serve as a fine backup, where if your primary station fails, a crummy voice signal is better than none!

WESTERN NEW YORK ATV HIGH ALTITUDE BALLOON

The ATV Group of Western New York will launch its second high-altitude helium balloon on Sunday, July 9, at 9 AM EDT. The launch will be conducted at the Batavia Hamfest in Alexander, New York (approx. 30 miles east of Buffalo and just south of Batavia).

Live ATV will be transmitted on 439.25 Mhz, with a video overlay displaying WA2CXW and altitude, temperature, and other information. Morse code beacon on 2 meters.

Amateurs monitoring the balloon's signals are invited to check into the voice net on 7.290 MHz (or just a little lower) starting at 8:30 AM EDT. No scrub date set at the time of this writing (7/2/95).

Location: Western New York
Date/Time: July 9/ 9:00 AM EDT
ATV: 439.25 MHz (articulated mirror camera)
Morse Beacon: 144.340 MHz (1 watt)
HF Voice Net: just below 7.290 Mhz at 8:30 AM EDT
Launch director: Roger Garbacz, WA2CXW

posted by Hank Riley, N1LTV

Please email for further info
or to submit news of upcoming balloon launches
for distribution on the Net.

Joe -

The message for the tailgaters zips by much too fast for me to be able to read. Unless I'm doing something uniquely wrong, I'd imagine that others may be missing this as well.

A group of us does amateur satellite demos for public relations and as emergency communications practice. These usually take place one Saturday per month at the Huntington Town Hall. These events are co-sponsored by the Larkfield Amateur Radio Club and the Town of Huntington.

Would it be possible to get a short announcement whenever we have such an event upcoming?

Also, during Shuttle missions, Ham-It-Up is a great source for current and accurate orbital data. I wonder how many users are aware of this. Would it be appropriate to also announce the best and greatest info available in area #25?

Press Release: June 1, 1995
1995 ARRL Digital Communications Conference
September 8-10th, 1995
Arlington, Texas (minutes from DFW airport)

Permission is granted to reprint any or all parts of this press release.

Full text is available on the Internet:
FTP: ftp.tapr.org WWW: hhtp://www.tapr.org/tapr E-Mail: tapr@tapr.org
---

It's that time again! Time to make your travel plans and put the finishing touches on your work for the upcoming 14th Annual ARRL Digital Communications Conference.

The ARRL Digital Communications Conference is an international forum for radio amateurs in digital communications, networking, and related technologies to meet, publish their work, and present new ideas and techniques for discussion. Presenters and attendees will have the opportunity to exchange ideas and learn about recent hardware and software advances, theories, experimental results, and practical applications. The Digital Communications Conference is not just for the digital elite, but for digitally-orientated amateurs of all levels of experience.

The 1995 Digital Communications Conference will be held on September 8-10th, 1995 in Arlington, Texas. Arlington is just minutes away from the Dallas/Ft. Worth International Airport, which is located in the middle of the country, and airfares have never been cheaper for this conveniently-located conference.

Not only is the Digital Communications Conference technically stimulating, it is a weekend of fun for all who have more than a casual interest in any of the ham digital communications modes. This includes BBS operators, networkers, DX-Cluster Sysops, software writers, modem designers, and digital satellite communications enthusiasts. The Digital Communications Conference is for all levels of digital operators -- a must conference to attend to get active on a national level. Now, more than ever, amateur radio needs this great meeting of the minds, since it is important that we demonstrate a continued need for the rich frequency allocations we now have by pushing forward and documenting our achievements. The ARRL Digital Communications Conference is one of the few ways to record our accomplishments and challenge each other to do more.

What can you expect during the 14th annual Digital Communications Conference ?

* A full day of papers and breakouts on Saturday for the beginner to the advanced amateur digital enthusiast.

* Two workshops, one on APRS on Friday and one on making use of the new PCS (Personal Communications Service) technology on Sunday.

* A Texas-sized banquet with a Special Guest Speaker.

* SIGs (Special Interest Groups) on Saturday following the banquet.

* Informal get-togethers throughout the weekend.

* A meeting facility that is perfect for this type of meeting.

* Vendor area and informal engineering discussions.

* Scores of nearby restaurants and entertainment (Six Flags Over Texas, The Ballpark at Arlington, Wet 'n Wild, golf).

* An event at which the most important new developments in amateur digital communications are announced.

* Digital 'movers and shakers' from all over the world in attendance.

* Plenty of Texas hospitality!

In addition to the presentation of papers on Saturday, two workshops will be held during the conference. On Friday, Keith Sproul, WU2Z, will hold a workshop on APRS packet-location software. Keith is the Chair of the TAPR APRS Special Interest Group, developer of the Macintosh version of APRS, and a leader in the area of APRS technology. This is a unique opportunity to gain insight into this fast growing new digital aspect of amateur operations that combines computers, packet radio, and GPS (Global Positioning Satellites). On Sunday, Dewayne Hendricks, WD8DZP, will conduct a workshop focusing on a survey of Personal Communications Systems and their applications and use in the Amateur Radio Service. Dewayne is an expert in the area of commercial wireless systems; his company WarpSpeed Imagineering, focuses on wireless Internet. This workshop presents an opportunity to learn how Personal Communications Technology (handheld and small business wireless systems) can be used in the amateur service.

The 1995 Digital Communications Conference is co-hosted by Tucson Amateur Packet Radio (TAPR) and the Texas Packet Radio Society (TPRS). TAPR has been active as an international amateur research and development organization since 1981 and was responsible for development of the TNC-2 and other amateur kits and publications. TAPR currently has more than 2500 members, worldwide. TAPR continues to provide leadership in digital amateur radio activities by supporting Special Interest Groups, conferences/meetings, publications, and research and development projects. TPRS has been active as an organization since 1984 and has been responsible for the development of the TexNet network in Texas, Oklahoma, Arkansas, and Missouri. TPRS membership now tops 500 members.

Anyone interested in digital communications is invited to submit a paper for publication in the Conference Proceedings. Presentation at the Conference is not required for publication. If you know of someone who is doing great things with digital communications, be sure to personally tell them about this! Papers are due by July 21, 1995, and should be submitted

to Maty Weinberg, ARRL, 225 Main Street, Newington, CT 06111 or via the Internet to mweinberg@arrl.org. Please contact Maty for detailed format requirements.

If you have attended a Digital Communications Conference in the past, just remember back to how much fun it was discussing the latest developments into the wee hours! If you have never been, then make your plans now to attend and find out how much fun the Digital Communications Conference can be.

There are few activities where the importance of your participation can be so much fun and important! What a great way to share and renew your enthusiasm for digital amateur radio! Getting together with colleagues from all over the world and bringing each other up to date on your latest work. All this, and more, for an unforgettable weekend of ham radio and digital communications. Make your travel and lodging arrangements now. We hope to see you at the ARRL Digital Communications Conference on September 8-10!

Full information on the conference and hotel information can be obtained by contacting Tucson Amateur Packet Radio, 8987-309 E. Tanque Verde Road, Tucson, AZ 85749-9399. Phone: (817) 383-0000. Fax: (817) 566-2544. Internet: TAPR@TAPR.ORG

Sincerely,
Greg Jones, WD5IVD Q President, Tucson Amateur Packet Radio
Dave Wolf, WO5H Q President, Texas Packet Radio Society

Note: If you need handouts or flyers for meetings, contact TAPR about getting what you need!

Hotel Information

Conference presentations, meetings, and workshops, will be held at the La Quinta Inn and Conference Center, 825 N Watson Road, Arlington, Tx, (800) 531-5900, (817) 640-4142, Fax (817) 649-7864, intersection of I-30 and Texas 360. Rooms rates are $53/single, $58/double, $63/triple, and $85+ for suites. When making reservations with the hotel, be sure to indicate you are attending the conference. Six Flags (larger than Disney Land), the Texas Rangers, and several other attractions are within a few miles of the hotel. If you are planning to stay at the hotel, it is highly recommended that you book your room prior to August 25th, 1995 -- a block of 100 rooms is reserved for Friday and Saturday. The hotel provides transportation to and from D/FW International Airport. You should contact the hotel to arrange airport transportation.

Registration

Contact the TAPR office by Phone, Fax, or e-mail (Internet: tapr@tapr.org) to pre-register or for additional meeting information. MasterCard and VISA accepted.

Digital Communications Conference
==========
- Pre-Registration (before August 21st) $30.00 *

- Late Registration or at door $35.00 *

* - Conference Registration includes:
Conference Proceedings, Sessions, Meetings, and Lunch.

- Saturday Evening Dinner $17.00 **

** - Dinner, Speaker, Prize Drawing (Limited Space)

Workshops
==========
APRS Workshop, Friday, 4pm - 7pm. Conducted by Keith Sproul, WU2Z

- Pre-Registration (before August 21st) $10.00

- Late Registration or at door $15.00

PCS Workshop, Sunday, 9:00am - 1:00pm. Dewayne Hendricks, WA8DZP
Survey of Personal Communications Systems (PCS) Technologies and their
application and use in the Amateur Radio Service

- Pre-Registration (before August 21st) $10.00

- Late Registration or at door $15.00

Contact TAPR to register for the DCC.
Tucson Amateur Packet Radio, 8987-309 E. Tanque Verde Road, Tucson, AZ

From: Gerald Schmitt <ggs@aerie.lanl.gov>
Message-ID: <3t9p12$3go@newshost.lanl.gov>
Source record: 24725

Hi,

Thanks for the look. A couple of students locally are interested in
trying to convert SAXEX/AMSAT downlinks from some of the geosync birds
rebroadcast locally I understand that this is done both for SAREX
and the Houston Tuesday night net. The students' school advisor has
asked me to help. I am not clear which birds carry these broadcasts
or what frequencies are involved. It strikes me that if the frequencies
are right one of the old C band block converters could be homebrewed
into a source for their efforts. Any help will be greatly appreciated.

73 de Jerry

1691 MHz is the output freq for the WEFAX product. Which is fairly simple
to receive, all you need is one or two loop Yags and a down converter.
Most down converters will bring the 1691 MHz signal down to 137.50 MHz
(which is one of 4 common output freqs of polar satellites so the same
receiver can be used on both.) Hope this helps. - Chris

1420. Two-Line Orbital Element Set: Space Shuttle

Newsgroup: rec.radio.amateur.space
Date: 1995-07-03 00:00:00 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.804812804@dolphin>
Source record: 24727

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (334) 409-9280, and are updated daily (when possible). Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current elements for the current shuttle mission are provided below. The Celestial BBS may be accessed 24 hours/day at speeds up to 14,400 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily), shuttle elements, and some documentation and software are also available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

```

1421. Two-Line Orbital Element Set Format

Newsgroup: rec.radio.amateur.space
Date: 1995-07-03 00:00:00 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.804813177@dolphin>
Source record: 24728

As a service to the satellite user community, the following description of the NORAD two-line orbital element set format is uploaded to sci.space.news and rec.radio.amateur.space on a monthly basis. The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (334) 409-9280, and are updated several times weekly. Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at speeds up to 14,400 bps using 8 data bits, 1 stop bit, no parity. In addition, element sets (updated weekly) and some documentation and software are also available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

==========

Data for each satellite consists of three lines in the following format:

```
AAAAAAAAAAAAAAAAAAAAA
1 NNNNNU NNNNNAAA NNNNN.NNNNNNNN +.NNNNNNNN +NNNNN-N +NNNNN-N N NNNNN
2 NNNNN NNN.NNNN NNN.NNNN NNNNNNN NNN.NNNN NNN.NNNN NN.NNNNNNNNNNNNN
```

Line 0 is a twenty-two-character name (this change is being made to be consistent with the name length in the NORAD SATCAT).

Lines 1 and 2 are the standard Two-Line Orbital Element Set Format identical to that used by NORAD and NASA. The format description is:

```
Line 1
Column Description
01-01 Line Number of Element Data
03-07 Satellite Number
10-11 International Designator (Last two digits of launch year)
12-14 International Designator (Launch number of the year)
15-17 International Designator (Piece of launch)
19-20 Epoch Year (Last two digits of year)
21-32 Epoch (Julian Day and fractional portion of the day)
34-43 First Time Derivative of the Mean Motion
or Ballistic Coefficient (Depending on ephemeris type)
45-52 Second Time Derivative of Mean Motion (decimal point assumed;
blank if N/A)
54-61 BSTAR drag term if GP4 general perturbation theory was used.
Otherwise, radiation pressure coefficient. (Decimal point assumed)
63-63 Ephemeris type
65-68 Element number
69-69 Check Sum (Modulo 10)
(Letters, blanks, periods, plus signs = 0; minus signs = 1)
```

Line 2
Column Description
01-01 Line Number of Element Data
03-07 Satellite Number
09-16 Inclination [Degrees]
18-25 Right Ascension of the Ascending Node [Degrees]
27-33 Eccentricity (decimal point assumed)
35-42 Argument of Perigee [Degrees]
44-51 Mean Anomaly [Degrees]
53-63 Mean Motion [Revs per day]
64-68 Revolution number at epoch [Revs]
69-69 Check Sum (Modulo 10)

All other columns are blank or fixed.

Example:

NOAA 6
1 11416U 86 50.28438588 0.00000140 67960-4 0 5293
2 11416 98.5105 69.3305 0012788 63.2828 296.9658 14.24899292346978

1425. WX Sat Decoding Software for Macintosh?

Newsgroup: rec.radio.amateur.space
Date: 1995-07-03 00:00:00 UTC
From: blanton@ni.net
Message-ID: <blanton-0307952206180001@xband.ni.net>
Source record: 24732

The newer Macintosh computers come with a built-in microphone jack which connects to a 8-bit analog-to-digital converter operating at 22 kHz. It should (theoretically) be possible to feed a receiver's output directly into the computer's microphone input and to decode and display weather satellite pictures entirely by means of signal processing software, without requiring any dedicated demodulation hardware. Has anyone written software to do this?

Lee Blanton, WA8YBT/6

there is such a software called radfax, can be found on umich and info-mac
mirrors. i had a look at it but not enough time to use it. let me know about
your success...

This AOLers are funny! :-) What you were listening to was NASA Select probably being retransmitted by the Goddard Amateur Radio Club (in Maryland). The original posting asked if anybody had made a contact with the STS-71 directly. To my recollection nobody has done it yet since the hams in the shuttle have been very busy while attached to MIR and have not had time to play radio.

Regards,

Rafael (KE6JSR)

PS: Don't take to seriously the AOL mini-flame! :-)

>>Has anyone written software to do this?

Yep

RadFax 0.9 is somewhat incomplete and may have bugs, it is capable of receive
weather faximile messages via the sound input port of Macintosh computers.
Basically you connect your Mac to a shortwave radio and tune in to weather fax
station. You set the reception speed and desired resolution and start receiving.

I'm not sure if I'm going to add the features that I still feel are missing, but
if I get enough shareware payments, I will do so. In any case, anyone who send
me a shareware payment of $25 (cash prefered, but I guess there might be a way
for me to cash checks too) will receive a disk with the full source code for the
program. You will need at least Think C 5.0 and TCL to compile the program.

Shareware payments should be sent to:

Juri Munkki
Ehrensvï¿½rdintie 20B8
SF00150 Helsinki, Finland

P.S. If you don't know what all this is about, you probably don't need the
program. I don't have the time to write a proper manual right now, so you'll
just have to experiment with the settings. My internet address is jmunkki@hut.fi.

Come on, folks. It's not "just" a moving point of light. That's only what it LOOKS like. What I "see" is much more than that. Think about it for a few moments -- when you see Mir/Atlantis with your own eyes, how do you FEEL? Don't discourage people who want to experience the same thing.

Hell yah! I took my girlfriend to this place on top of a hill near a lake
and we fed the ducks until it was time. Then, just after sunset, there it
was in all it's tiny but brilliant glory. We loved it! Real romantic!

The next night I was at a party and we were all drinking and I took
everyone out at the right time and showed them it also. It is a GREAT way
to turn people onto the space program who normally wouldn't give a shit.

The problem is that you don't say where you are in this great big wide world of ours, "Wiz"...

So, assuming you're in the Dallas-Fort Worth area (since I see you're the 'Wizard" of Internet America DFW), try the 445.000 re-broadcaster at the University of Texas @ Arlington, if it's within your reception range.

And, next time... feed us more information so we're not guessing at how to answer your question, ok?

From: n9yjz@earth.execpc.com
Message-ID: <3teup3$7lm@homer.alpha.net>
Source record: 24745

I recently came upon a TS-790 at a very good price, (2m/440 base rig) and have quickly jumped into the mainstream of VHF/UHF operating. I now need to set up a good VHF/UHF antenna system that has good terrestrial performance along with satellite performance as well. I know already that for truly good sat performance I'll need an az/el rotator...no big deal... but what kind of antennas should I use to get good performance on both types of communication, both ground and sat? Can I get away w/ a circularly polarized antenna for terrestrial contacts, or can I get away with a SSB beam for sat contacts? Is there an antenna that is good at doing both? Thanks to all who choose to reply...your response is very much appreciated. 73!!

We were moored at Isthmus Cove at Catalina Island and passed the word to
the other boats moored for the July Fourth weekend. Had everyone watching
and those with radio rigs were listneing on the 448.5 repeater frequency.
Got a QSL during the trip.

We converted a lot of disinterested people into enthusiasts and didn't
have to use our own money to do it! :)

Please be advised that the SAREX uses different frequencies for uplink
and downlink. On this last pass over Los Angeles,
someone nearby was trying to contact the shuttle on the shuttle's
downlink frequency. Not only did the shuttle not hear them, but they wreaked
it for everyone else.

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (334) 409-9280, and are updated daily (when possible). Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current elements for the current shuttle mission are provided below. The Celestial BBS may be accessed 24 hours/day at speeds up to 14,400 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily), shuttle elements, and some documentation and software are also available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

Joe -

The Larkfield Amateur Radio Club will be having an Amateur Satellite Communications demonstration on Saturday, July 15 at the Huntington Town Hall, Route 25A, Huntington, NY. Setup will begin at 08:30 and the demonstration will continue until the early afternoon.

This activity serves as Emergency Communications training for the Huntington ARES/RACES unit as well as a public demonstration of satellite communications techniques. Anyone interested in Satellite Communications is encouraged to attend.

For information, contact Ken Ernandes, N2WWD

Well, the night after the docking I'm pretty sure I heard someone trying to get the shuttle's rig on the air. Something like "I don't think it's transmitting" (ironic, huh?). This was on the 145.840 downlink. I tried getting back to them on 144.45, but no answer.

A day later I heard Ellen KB5SIX making contacts from Mir on 145.550. No luck for me, but there were definitely others getting in. The Shuttle was quiet during that time.

All other passes were either quiet or during a time I wasn't near the radio.

Rats.

>I recently came upon a TS-790 at a very good price, (2m/440 base rig) and have quickly jumped into the mainstream of VHF/UHF operating. I now need to set up a good VHF/UHF antenna system that has good terrestrial performance along with satellite performance as well. I know already that for truly good sat performance I'll need an az/el rotator...no big deal... but what kind of antennas should I use to get good performance on both types of communication, both ground and sat? Can I get away w/ a circularly polarized antenna for terrestrial contacts, or can I get away with a SSB beam for sat contacts? Is there an antenna that is good at doing both? Thanks to all who choose to reply...your response is very much appreciated. 73!! Joe Moschella, N9YJZ Brookfield, WI 53005

A true CP yagi is difficult to design. A true CP antenna on a satellite (especially on large wavelengths) is difficult to design. Those that are out there are not perfect CP. Most of the time a satellite's antenna is not pointed at you. So you'll never receive a clean cp wavefront. Go with a horizontal yagi and if you really want to go nuts, set it up so you can rotate 360 degrees in polarization, because you will at times get a better signal not in the horizontal or vertical, but somewhere in between! All non FM yagis work well, M2 yagis seem to be the favorite today. Stay away from yagis with a gamma match.

PS Why even consider a vertical yagi for FM repeaters? You'll spend less time on repeaters once you wet your mouth wet with Meteor scatter, Aurora, E skip, Tropo...ducting, and playing king of the mountain or grid :-)

To all radio amateurs

SB SPACE ARL ARLS010
ARLS010 SAREX helps NASA

The Space Shuttle Atlantis landed in Florida on Friday, July 7, at 1454 UTC. The landing ends the STS-71 mission, which included a historic docking with Space Station Mir on June 29.

Mission Specialist Ellen S. Baker, KB5SIX, and Pilot Charlie Precourt, KB5YSQ, conducted Shuttle Amateur Radio EXperiment (SAREX) activities using the shuttle's VHF radio. Early reports indicate that the astronauts made successful contacts with five student groups who had prearranged contacts, and made numerous random voice contacts with individual amateurs.

In keeping with the experimental nature of SAREX, volunteers around the world also supported numerous tests to help NASA. The crew made a number of contacts with amateurs using the Shuttle-Mir VHF radio to test the operational configuration of the radio hardware and antenna. The radio will be used to facilitate at least six more planned Mir docking missions.

SAREX reports and QSLs may be sent to ARRL EAD, STS-71 QSL, 225 Main Street, Newington, CT 06111-1494, USA. Include the following information in your QSL or report: STS-71, date, time in UTC, frequency and mode (FM voice). In addition, you must also include a SASE using a large, business-sized envelope if you wish to receive a card.

The Sacred Hearts Academy Radio Club in Honolulu, Hawaii has volunteered to manage the cards for this mission.

The next mission supporting SAREX activity is STS-70, scheduled for launch next week, on July 13. Listen to W1AW for operating details and frequencies.

So far I haven't heard ANY sarex activity. Anyone else hear any? anyone make a contact?

I guess that's about it for this mission since they come down tomorrow.

Tom

You'll no doubt hear that you can use less expensive linearly (horizontal or vertical) polarised antennas for satellites. This is quite true, however there are a couple of points to consider beyond the cost factor (which is what drives people to the linear antennas)...

1. Circular antennas can work with linear signals of any sort quite well. This means that a c/p antenna can be used for vertically polarised mobile and repeaters as well as sats. Try using a vertically polarised antenna with a weak horizontal ssb signal! Or, at that, a horizontal antenna for far away repeaters.

2. DX signals (terrestrial) are likely to arrive in most any polarisation, vertical, horizontal, or whatever in between. A c/p antenna will get them all quite well.

So, the c/p antennas may cost more, but they do a ->very<- good job all around. They will have about 3db less gain on a linear polarised signal, but if you start with a good one with about 15 db plus gain, this is not such a big deal.

Above all, don't go cheap. You get what you pay for. I've seen the cheap ones get completely fouled in the rain and snow, while the good ones keep on ticking.

A disadvantage of circularly polarized antennas is that to work other
c/p stations on both direct and bounce paths you need to be able to
switch between RHCP and LHCP. Bounce paths can work very well when you
both see a large reflector, such as a mountain range.

The antennas on the satellite also make a difference. If they are
truely circularly polarized and properly oriented, there is merely
a 3 dB loss that can be made up by using a bigger linear array.
But, many satellites aren't this elaborate, so you get fades that
are often worse if you use the bigger linear array. Hopefully,
Phase 3D will make linear arrays more popular.

If you have local noise problems, you might be better off with a
linear array--especially if you use one of the designs optimized
for EME arrays. I suspect these antennas have much cleaner patterns,
which ought to increase the useful satellite time you have available.

On the other hand, if you just need 10 to 15i dB of gain on
435/1.2/2.4 I think a helix works quite well. But, if you want
more gain to extend your troposcatter range, linear yagis make
more sense. Your actual troposcatter range is also a big factor.
The curve flattens out, so that extra investment is often more
useful to a station with a range of 150 miles, as opposed to 30
miles.

Greetings,

I've just recently D/L'd an evaluation copy of SatTrak (Mac) and am attempting to use it. I have however encountered a problem.
Under "site info", along with site longitude, latitude and elevation, the program asks for something called "mininum satellite elevation" in degrees. Can anyone tell me what its asking for?

Thanks.

Michael

Although I'm sure they have been well publicised, it might be a good idea to quote them for everyone's benefit. I'm afraid I don't have them myself. I guess it might be a bit late for this mission though.

1463. ARTOB Launch 07-02-95

Newsgroup: rec.radio.amateur.space
Date: 1995-07-08 00:00:00 UTC
From: Oliver Welp <welp@uni-muenster.de>
Message-ID: <3tme9j$1q8e@majestix.uni-muenster.de>
Source record: 24670

[Please, spread this message to you favorite PR mailbox/BBS,...]

The Nienberge Amateur Radio Group (NW Germany) launched an ARTOB on
sunday, 07-02-95. This is what we did:

Balloon:
call sign: DL0ART/am
QRGs/mod.: 145.200 MHz FM data and call sign (CW) (beacon)
(six tone sigs have been transmitted after the call sign:
two serve as a reference, the others show altitude, balloon and
outside temperature, batterie voltage)
29 MHz remote control
power: 2.5 watts
antennas: turnstile - 2 m
lambda/4 vertical - 10 m
weight: balloon: 1320 g
rig: 1340 g
-> totals 2660 g
diameter balloon: 7.5 ft
gas: hydrogen
lift when launched: abt 200 g

The launch on 07-02-95:
(UTC)
11:15 arrival of the team at launching site Schoeppinger Berg (NW Germany),
JO32PC
11:18 aviation weather data:
ground wind 100 deg / 3 knots
upper wind 130 deg / 6 knots
QNH 1008
no clouds below 5000 ft
11:25 infalting of the balloon
(...)
11:52 turning on transmitter
(...)
12:17 launch
12:20 altitude: 1895 ft
12:21 altitude: 2110 ft
12:22 altitude: 2460 ft
12:23 valve opened (30 s) by control team (DF1QE, Armin)
12:28 -same-
from
12:30 five ARDF teams give QTE information every 10 min. to DF coordinator
Joachim, DL3YBQ. Talk back via repeater DB0EG.
12:34 valve opened (30 s)

12:36 valve opened:
12:39 rate of climb is abt zero; the valve should be closed. The control team is in a village at that time, and somehow the remote control fails (thuogh using 150 W on 10 m). The valve stays opened another two min. till (finally) the control team succeeds with their commands. The balloon now sinks by 120 ft/min.
12:40 greatest altitude: 6200 ft
13:00 altitude: 3660 ft
13:05 altitude: 2785 ft
13:08 altitude: 2085 ft
The DF teams are informed and move to the expected landing site
13:16(?) balloon lands near Metelen JO32OF
13:33 First DF teams DF1QE (Armin), DL3YBO (Ludger) and DL9QJ (Oliver) reach the balloon. All equipment is fully operational (even the teams, hi), the balloon stands (!) in a little grove and is easy to recover.

conclusion:
The sigs from the balloon have been (accidentally) re-transmitted by DB0WA, repeater in Aachen (JO30BT). We got a few more reception reports, but we still would appreciate more!

The planned flight on constant flight level did (because of the remote control failure) not happen. The batterie was almost exhausted (much to fast), because of a defect cell.
The beacon power was too high, maybe a couple hundreds mW would have done.
The DF teams need directions from the coordinator where to go.

Besides that, this launch is considered to be a success, especially the (most of the time, hi) controlled landing procedure looks promising. Now the operation time is not limited by a bursting of the balloon in high altitude. It is found easy to recover all the (not yet) valuable rig.

Another launch will be performed on one the next weekends using almost the same rig. After that, data transmissing will be changed to a PR like protocol, using a (8051 or so) micro controller. A repeater 2 m / 70 cm is planned, also adding a CCD camera for ATV or FAX/SSTV.

A big thank you to anybody participating, especially to Armin (DF1QE) who did most of the technics.

Any suggestions and response are welcome (address see below). We'll announce the next launch (always on a sunday) 48 h in advance.

Best 73, Oliver

From: afn13094@freenet.ufl.edu
Message-ID: <3tmig3$ri4@huron.eel.ufl.edu>
Source record: 24671

I got my first sat station set up and I have a few questions. The harness that comes off the antennas has a so239, I'm looking for a preamp and have noticed that they come with N or BNC connectors. How should I work this? I know nothing about hardline and N connectors. Do they make N connector to fit RG213 or 9913? Or do they make a pl259 male to N female adaptor? Would this adapter cause significant loss? My radio to feed point length is about 30 feet. Thanks for any help, Patrick KC4VKG afn13094@freenet.ufl.edu

1465. Two-Line Orbital Element Sets (TLE634)

Newsgroup: rec.radio.amateur.space
Date: 1995-07-08 00:00:00 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.805169932@dolphin>
Source record: 24672

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (334) 409-9280, and are updated daily (when possible). Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at speeds up to 14,400 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily) and some documentation and software are available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space.news and rec.radio.amateur.space. This week's elements are provided below.

1466. New England 2mtr Beacon

Newsgroup: rec.radio.amateur.space
Date: 1995-07-08 00:00:00 UTC
From: aa679@ccn.cs.dal.ca
Message-ID: <DBDK7I.8vn@cs.dal.ca>
Source record: 24673

Does anyone know the location and freq of any New England or Long Island
2 mtr beacons.

We have a 2 mtr marker beacon out on Sable Island (90 mi off the coast
of Nova Scotia), but I think it is too close. We can get a good sig.
from it, almost any day.

We are planning to try and track some meteors during the Perseids meteor
shower on 12 Aug.

We will be using X band radar, VHF, HF and LF plus a photomultiplier tube.

No doubt there are others, too. I did mention that it was _one_ ftp site.

>
>What do these sattelites broadcast?

These satellites all broadcast Automatic Picture Transmission (APT) imagery. Nominally, this is 4km by 4km resolution. The imagery can be (tolerably) received with a scanner, but a somewhat wider IF filter (say 40kHz) is recommended. The imagery is broadcast in analogue form.

APT provides low data rate wide field (+/- 55 degrees edge to edge) earth viewing transmissions. In the case of the NOAA satellite, APT is derived from two channels of the high resolution AVHRR imagery sensor (AVHRR = Advanced Very High Resolution Radiometer). The transmission format is AM (amplitude modulation) on a 2.4 kHz subcarrier, with two imagery lines per second.

1469. Shuttle audio re-transmitting...

Newsgroup: rec.radio.amateur.space
Date: 1995-07-09 00:00:00 UTC
From: n5zgt@swcp.com
Message-ID: <3tna9s$rk3@sloth.swcp.com>
Source record: 24676

Hello,
TNX for reading this message.
I am planning on putting up a 2 meter repeater in the Albuquerque, NM area that will re-transmit shuttle audio. But I need a source to get the audio from to begin with. I know I can get it from Spacenet 2 (Where Nasa Select channel comes from), but I have heard that they have press conferences, etc on it. And I do not want that stuff being transmitted in the Amateur bands.
Do you know what a good frequency is (satellite, etc) where I can capture shuttle audio and be able to put it on the air? I need a sorce that is available 24 hours.
Thanks! All help will be appreciated!

Patrick;
Amphenol connector #82-202-1006 is an N-connector made specifically for Belden 9913--you can get them at AES or HRO. There are PL259 to N adapters as well. I recommend using N connectors on your coax and the adapter--get one with a good teflon dielectric like the ones made by AIM electronics. The ones at Radio Shack are questionable, IMHO. You're likely to have less loss with an N connector and the adapter, because it's next to impossible to get a PL-259 on without a significant impedance change, where an N connector done right is nearly invisible at 2m/70cm on a reflectometer. The other option (a better one) is to replace the connector on the antenna harness with an "N" type.

> Under "site info", along with site longitude, latitude and
> elevation, the program asks for something called "mininum
> satellite elevation" in degrees. Can anyone tell me what its
> asking for?
>

Michael,

The mininum elevation is a height or distance above your horizon that you want SatTrak to report on, for example, to the south of my QTH I have a large hill so any sat that is less that 3 degrees above my horizon is useless to me as I can't work it do to the hill. I therefore tell my sat software not to report anything to me untill it's at least 3 degrees above the horizon. Your QTH may be better so you might want to set it to 0 degrees.

If you interested in this kind of thing you might also want to have a look at ftp.demon.co.uk /pub/ham/mac lots of other Mac Sat software and stuff like that. You'll also find a programme called OrbiTrack which you might want to try.

Regards,

Sean.

: recommended. The imagery is broadcast in analogue form.

: APT provides low data rate wide field (+/- 55 degrees edge to edge)
: earth viewing transmissions. In the case of the NOAA satellite, APT is
: derived from two channels of the high resolution AVHRR imagery sensor
: (AVHRR = Advanced Very High Resolution Radiometer). The transmission
: format is AM (amplitude modulation) on a 2.4 kHz subcarrier, with two
: imagery lines per second.

In plain English, he's trying to tell you that these satellites take
pictures of clouds using various radar technologies and transmit them on the
2 metre band.

Just kidding, I don't have any experience with a MAC !!!
There are a lot of trackking programs, as you possibly know, for the PC.
I use the programs traksat version 2.80 and pctrack version 1.1!!
i'm very content with these program's

all the best, Peter de Blecourt.

1478. Egg beater antennas for sat work?

Newsgroup: rec.radio.amateur.space
Date: 1995-07-10 00:00:00 UTC
From: kory@avatar.com
Message-ID: <3tsl2v$bg7@avatar.avatar.com>
Source record: 24685
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.space

I very new to satellites. I have a Yaesu FT-736 with a Diamond X510
omni ground plane antenna. I've had very little success being able to
pick up any of the sats. I can get DO-17 and the MIR, but very faintly.
I now part of the problem is the antenna since omni radiate outwards and
upwards. I'm thinking of getting an egg beater style antenna since they
are truly omni and I won't need to buy a az/el rotor.

Couple of very naive questions:

1. All of the EB antennas seem to have a gain of 1 db. Will this be enough?

2. I think I definitly well need to mast mounted pre-amp. Is this correct?

3. Also, is a lower gain directional antenna (such as a yagi) better than
a high gain omni? For example, my X510 had an advertised gain of 11.7 db
on 70cm. Would I get better sat performance with a lower gain yagi?

4. And finally, this is kind of related to question #3. Can the low gain
be compensated with a mast mount pre-amp? In other words, if I take an EB
antenna with a gain of 1 db and put a pre-amp with a gain of 20 db in front
of it, do I end up with a EB antenna with an effect gain of 20 db? Sounds too
simple.

Any help or pointers would be greatly appreciated.

Thanks,
Kory

There are almost all adapter combos. Look for brand names, Amphenol for one.
Cheap import adapters have broken on me. Also read an article saying avoid nickel
plating at UHF. Silver-plating is usually is a sign of higher-quality.
Connectors for RG series coax won't work with 9913. You may cobble it
together, but in the long run...

1480. Western Indiana ATV Balloon Launch

Newsgroup: rec.radio.amateur.space
Date: 1995-07-10 00:00:00 UTC
From: au156@yfn.ysu.edu
Message-ID: <3tr9pc$i45@news.ysu.edu>
Source record: 24687

INDIANA ATV BALLOON LAUNCH

On July 15 at 7:30 AM EST (12:30 UTC), weather permitting, there will be a helium balloon launch from Veedersburg, Indiana (25 miles east of Danville, Il) to test the deployment of 3 helium balloons to lift a package aloft with minimal spinning on the package.

The package will contain a Amateur Television transmitter on 439.250 Mhz with horizontal polarity on the antenna showing two camera views, plus a video Id'er with the call of KT9V. A GPS receiver and packet telemetry software will give position of the balloon at 1200 baud and other balloon status on 446.000 with the call of WB9IHS.

Also on board will be a cross band repeater with call of W9DUU.
Input will be on 144.300 MHz FM with outputs on 444.850 and 52.525.

A HF net on 3.871 MHz will be hosted by Emmett Dodson, K9YKX, to provide status of preparation, launch, and balloon operation during the flight.

This balloon is expected to reach an altitude of 100,000 feet or more and should have a 440+ mile range from the balloon at peak altitude.

All amateur operators are encouraged to participate in this flight.

Location: western Indiana (Veedersburg, IN)
Date/Time *: July 15/ 7:30 AM EST (12:30 UTC)
FM Repeater: Input - 144.300 MHz
Output - 444.850 MHz; 52.525 MHz (W9DUU)
ATV: 439.250 MHz two cameras plus video ID
(KT9V)
Packet: 446.000 MHz GPS derived position and
misc. telemetry (WB9IHS)
HF Voice Net: 3.871 Mhz (net control K9YKX)

* Note: slight launch time change from
earlier posting (0:30 later) 7/10

1481. Microwave Frequency Stability

Newsgroup: rec.radio.amateur.space
Date: 1995-07-10 00:00:00 UTC
From: dbraun@ichips.intel.com
Message-ID: <2DJ0mmvRnPxl076yn@ichips.intel.com>
Source record: 24688

I am planning to builda AO-13 Mode S downconverter,
and I was wondering: How critical is the frequency
stability of the local oscillator? I.e.: to what extent
do frequency error, drift, and phase noise degrade
Mode-S SSB communications? Or are these problems all
swamped by Doppler shift anyway? Is it common to use
a TCXO, crystal oven, etc to reduce these problems?

Thanks,

Doug Braun (N1OWU)

YES! The frequencies AND protocol should both be well published to maximize
the enjoyment of everyone!

I had a similar problem with a SAREX mission a little over a year ago, only my
problem was that as soon as some @#$% ~30 miles from me could no longer hear
the shuttle, he started yakkin' away on the shuttle down-link frequency, while
I was still listening to a wonderful shuttle QSO from the shuttle in progress.
AAAARRRRGGGGGH.

Sooooo - stay off those shuttle down-link frequencies, EVEN IF YOU THINK the Shuttle is
not overhead. Just because you can't hear them doesn't mean someone else can't.
Also, because the orbit can change, you may also accidently blast on them if
you don't have the latest orbital information, and are presuming the Shuttle is not
within' range.

: Under "site info", along with site longitude, latitude and elevation, the
: program asks for something called "mininum satellite elevation" in
: degrees. Can anyone tell me what its asking for?

Sure,

This is the minimum elevation that a satellite must rise above your horizon
in order for you to be interested in it. If you put in zero, you may get
listings of lots of satellite passes that only get 1-degree, or 2-degrees above
the horizon. You'll never see these, and probably never hear them with a
radio, either. So, depending on your local terrain, what your interest is
(radio contact, optical sighting, etc.) set this parameter to some number
between 2 and 5 degrees.

For example, a couple of weeks ago I was calculating visual MIR passes, and
I was in a wooded area with a lot of humidity and haze on the horizon, so I
was only interested in passes that achieved an elevation above the horizon
greater than 15 degrees. I set the "minimum satellite elevation" to 15 degrees,
and the program only lists the passes I'm interested in.

: you don't have the latest orbital information, and are presuming the Shuttle is not
: within' range.

: -Andy Goris
: AA0CM
: goris@fc.hp.com

People can at LEAST get a sat tracking program so they can SEE where
shuttle or Mir is and know when they go below the horizon. The least they
can do is to wait at least 10-15 mins. to start their ragchew but then
they may interfere with a Mir pass at times as well. I do hear
people on the downlink from time to time. Can't stress it enough.....
PLEASE..DO NOT TRANSMIT ON THE DOWNLINK! That's what the uplinks are for!

Yup, suppose your site is surrounded by hills, then AOS will be that much
later than for a site in the middle of flatlands. For reliable AOS & LOS
prediction you need to supply the elevation of the highest point of your
site's horizon, as this is the minimum satellite elevation that will give
line of sight.

>do frequency error, drift, and phase noise degrade
>Mode-S SSB communications?

For an excellent demonstration of what a little drift can do, listen in on an
SSB signal that is otherwise stable, and then vary your Rx frequency by
different amounts. As little as 100 Hz can make it sound really bad.

> Or are these problems all
>swamped by Doppler shift anyway?

No, just compounded! Actually, the Doppler doesn't shift all that much on
AO-13 Mode-S, since S is on at Apogee.

>Is it common to use
>a TCXO, crystal oven, etc to reduce these problems?

I have not seen these used in commercial designs, but they would be welcome.
The biggest problem is that the frequency of the oscillator is multiplied
many, many times. This also multiplies any drift, so whatever you can
(reasonably) do to provide some stabilisation will help in the long run.

Mostly, we just need to make sure that our oscillators are turned on well in
advance of operating, so that they are up to temp. and relatively stable. If
you try to operate them cold (during warming) it can be a wild ride!

Have fun!

> Couple of very naive questions:
>
> 1. All of the EB antennas seem to have a gain of 1 db. Will this be enough?

Enough depends upon a number of things. For Low Earth Orbit satellites such
as DO-17 and MIR, almost any antenna will be enough. Antennas with gain
towards the horizon such as your X510 will help. Remember that the gain needed
is proportional to the path loss. At high elevations, the path loss is minimized, so
the gain requirements are minimized. At low elevations, the path loss is maximized
(and actually the LEO birds spend most of their time at low or lower elevations
simply due to the properties of their orbits) and hence gain at low elevations is
beneficial.

For the non LEO birds such as AO-10, AO-13, and the soon to be launched phase 3D
bird, omni-directional antennas, even with gain, aren't going to be enough. The link
budget for these satellites is such that you need directional antennas to reliably work
them.

> 2. I think I definitly well need to mast mounted pre-amp. Is this correct?

A low noise mast mounted pre-amp is almost always a benefit. How much of
a benefit depends upon its impact on the system noise figure. There have been
some good articles in QST over the last 10-20 years that cover system noise
figure and how to determine the impact of a pre-amp (either mast mounted or
shack mounted) on your system's receive capability. It is safe to say that if
you have a reasonable low noise pre-amp (say NF of 1 dB or less) and normal
feedline losses (9913 or worse for 50-100 ft), and an average front end (NF of
say 2-4 dB), then a good pre-amp is going to make a significant difference.

> 3. Also, is a lower gain directional antenna (such as a yagi) better than
> a high gain omni? For example, my X510 had an advertised gain of 11.7 db
> on 70cm. Would I get better sat performance with a lower gain yagi?

Well 11.7 dB on 70 cm isn't bad, but even a relatively short yagi on that band
is going to have better gain. In addition, that gain is only at the horizon, not at

elevation angles greater than say 30 degrees. A modest yagi (say an 8 ft 16 element crossed yagi) with AZ-EL rotors is going to outperform your X510.

> 4. And finally, this is kind of related to question #3. Can the low gain
> be compensated with a mast mount pre-amp? In other words, if I take an EB
> antenna with a gain of 1 db and put a pre-amp with a gain of 20 db in front
> of it, do I end up with a EB antenna with an effect gain of 20 db? Sounds too
> simple.

Yes and no. Antenna gain is always preferable to amplification gain. A low noise pre-amp gain only amplify what it is given. So a 1 dB antenna with a 20 dB gain pre-amp, is not going to perform at all like a 20 dB antenna with a 1 dB gain pre-amp. A low noise pre-amp will help a good station, but it will not make a bad station into a good station. Again, get the QST articles on calculating system noise figures and you'll be able to make the comparisons yourself.

The primary disadvantage to higher antenna gain is the narrowing of its beamwidth. This means that the antenna most be more accurately pointed and must track the satellite's position more carefully. These disadvantages though are more than offset by the improved overall performance. Given a choice between 3 dB of additional antenna gain and 3 dB of additional pre-amp gain, you'd be far better off taking the 3 dB of additional antenna gain. Remember that a pre-amp can onl amplify the signals it is provided. Additional gain over the losses in the feedline and switching gear only amplifies the noise along with the signal.

: simple.

Yes it is too simple. You have to take into account the amount of
background noise, commonly expressed in Kelvin. On 2 meters, the
background noise is sometimes high enough that some people get little
improvement using a mast mounted preamp.

Consider the following simplified case on 435 MHz:
Very quiet sky 50 Kelvin average
Warm Earth 300 Kelvin.
70 Kelvin receiver

Omni antenna case: 1/2*50Kelvin+1/2*300Kelvin+70 Kelvin=245 Kelvin

Directional antenna that only looks at 20 Kelvin sky
20Kelvin+70 Kelvin=90 Kelvin

effective gain from lower noise pickup 10*log(245/90)=4.3 dB.

Thus, a 15 dBi beam may actually have an effective gain of
19 dBi. See chapter 17 of the 1995 ARRL Handbook or Chapter
12 of an older Handbook for more details.

: Any help or pointers would be greatly appreciated.

: Thanks,
: Kory

1497. WinOrbit 2.6 available

Newsgroup: rec.radio.amateur.space
Date: 1995-07-11 00:00:00 UTC
From: Carl Gregory <cgregory@uiuc.edu>
Message-ID: <3ttvbt$oev@vixen.cso.uiuc.edu>
Source record: 24704

The latest version of WinOrbit (2.6) is now available on
oak.oakland.edu and ftp.amsat.org. A description of changes, and
an overview of the program, are given below:

New Features in version 2.6
---
* Glossary has finally been included.
* Immediate display of all visible satellites, regardless of
whether they are being tracked in a Map Window.
* Sun and Moon may be tracked for antenna or receiver calibration.
The algorithm is built-in, no keps are required.
* Immediate display of all stations in the QTH database visible from
a particular satellite for mutual visibility determination.
* Latitude and longitude display and specification made more flexible.
Lat/long displays can be in decimal degrees or degrees,
minutes, seconds; and with choice of +/-, or E/W notation.
Choice of direction for positive longitude (E or W)
Shift-click on a map adds a point to the QTH database.
Ctrl-click on a map changes the observer location.
Lat/long and grid square of the point under the mouse cursor
can be displayed on map or globe.
* AOS for next pass now displayed on maps and in Info Window.
* Calculation of EQX, AOS, and Apogee/Perigee for Ephemeris tables
improved (more accurate, some speed up).
* Ephemeris output to an existing file is added at the end ("append")
instead of overwriting the previous information.
* Two-line element sets can be saved from the edited orbital elements.
* User-provided maps may now be used for the background, giving
added display flexibility.
* Fixed bugs in Help:System Info and Colors dialog.
* A companion program for antenna control using the Prairie Digital
board will shortly be available from the author (NO TSRs!).

Program Overview

WinOrbit is a program for computing artificial Earth-satellite
position and visibility, with the Amateur Radio satellite
operator in mind. It was written for the Microsoft Windows 3.1
operating system. WinOrbit is free (not shareware). The
latest version is 2.6.

The principal feature of the program is a series of tracking
windows, one per satellite, which display the current position of
the satellite and the observer on a simple world map, together
with information such as footprint, past ground track, bearing

(azimuth), distance, and elevation above the observer's horizon.

Additional features include:
* Simultaneous tracking of up to 20 satellites.
* Real-time, pseudo-real-time, and manual calculation modes.
* A "view from space" map presentation showing what a particular satellite sees.
* Computation of Doppler shift and path loss for communications satellites.
* Selectable tracking detail, including doppler shift and free-space path loss, for a single satellite.
* Display sun position for eclipse determination, and other observers for mutual visibility.
* 4 different orbital calculation algorithms (selectable).
* Tracking data (Keplerian element sets) read directly from standard, off-the-air bulletins in two different formats (up to 500 satellites). No pre-processing is needed, just grab a bulletin file.
* Propagation of pre-launch keps and other element updates.
* Utility functions for modifying and comparing published element sets, including post-launch updating of pre-launch elements, and saving composite data files compiled from various sources.

* Observer (QTH) data (latitude, longitude) may be imported from a simple text database (up to 1000 locations). Entry by grid-square or mouse-on-map is possible.
* Printing of tables of tracking data (Ephemerides) in several formats. Table printing does not interrupt tracking. Table output may be directed to a disk file.
* On-line help, including direct access to text information about Amateur satellites from the tracking windows.
* Standard Windows interface for all functions - no commands to memorize. Both mouse and keyboard can be used for most functions.
* DDE server interface to tracking-antenna hardware controllers.

This program is available via internet, by anonymous ftp from:
ftp.amsat.org in /amsat/software/windows/tracking/winorb26.zip
oak.oakland.edu /pub3/hamradio/pc/satellite/winorb26.zip
The file VBRUN300.DLL is also required - available from the same sites.

Future enhancements might include (depending upon interest):
Bug fixes (when reported by users)
Corrected/augmented satellite information supplied by users.
Enhanced satellite database maintenance features
Additional table formats (as requested by users)
Fancier map formats
Speedups
BLAT/BLON calculation

Rotor and rig control interface

If you use a scanner with a "wide" bandwidth, that's probably *too*
wide (good for FM broadcast, maybe). This may mean noisy pictures. If
you have a tracking directional antenna (cross-polarized Yagis, 6 or
more elements each), low-loss coax, and perhaps a preamp, you may be
able to get satisfactory results.

Len,
Two issues, you'll have more line loss at 1691 than at 137, secondly You'll want 30-50 kHz bandwith. If you have the signal strenght and the bandwith then their is no advantage to the downconverter, you'll still need a preamp at the antenna.

Good Luck,

Kevin N9JKP

In article <3tu2le$4snr@ns3-1.CC.Lehigh.EDU>, c002@Lehigh.EDU says:

The NOAA LEO WX sat txs a 30KHZ signal. I am currently using a
PRO2004 in the wide band (75KHZ) mode. This is way too wide and
really destroys the sn. Dr. Taggart has a good book on the whole
subject. I stroungly reccomend that you get the book. The ARRL
has it. At least you got something with the 15Khz BW on your icom.
I could not even get sync pulse from any of my noarrow band stuff.
The meteor series has a slightly narrower bw , but still much wider
then your icom. Dr. Taggert says 35Khz with fairly wide filters
should be ok. I don't have the book in front of me, so don't take
these figures as gospell. You also need a better antenna than the
standard antenna used by hams. I am using a radiio shack disk cone
with an older JFET preamp. At the scanner. I am building a trunstile
over reflectors. It should go up this week end. And yes the preamp
will go at the antenna end. Between work, life and family there just
is not enough time to go around. I am getting the last bugs out of my
A&A wefax demode board interfaced to the printer port. Everything about
this project has taken about 4 times as long as I had thought it would.
Good luck and really think about getting the book. I think it is the
4rth edition. It is full of practical advise. He has been doing this
decades.

>> attempting to use it. I have however encountered a problem.
>> Under "site info", along with site longitude, latitude and elevation, the
>> program asks for something called "mininum satellite elevation" in
>> degrees. Can anyone tell me what its asking for?

This lets you tell the program how far above the horizon a satellite
must be before SatTrak will consider it visible from your site. You
could just set it to zero. But I prefer to keep it somewhere between
2 and 5 degrees so that I'm not bothered with having to read pass
information on passes that neither I nor my radio can see. (I consider
5 degrees to be about minimum for those purposes, but I usually keep
this setting at 2 degrees so that SatTrak will let me know when a
bird is going to pop over the horizon.)

I like SatTrak a lot. I particularly like that it tells you in its
printouts when a satellite will be eclipsed. That saves you from
wasting your time looking when it's too late in the evening (or too
early in the morning) to see something. (Of course, eclipse information
isn't relevant for radio contacts, but it's great if you want to see Mir
or the shuttle yourself.)

73,
Patty N6BIS

>can rotate 360 degrees in polarization, because you will at times get a
>better signal not in the horizontal or vertical, but somewhere in between!

I disagree. CP antennas take a 3 dB gain hit when used with linear
polarized sources, but they can dramatically reduce the effects of
spin modulation on satellite signals, even when the satellite off-
pointing is giving you eliptical polarization. That can amount to
a 10 dB or greater improvement in receiving the satellite signals.
I consider that a good trade against the 3 dB loss when used
terrestrially with stations having linearly polarized antennas.
Besides, unless it's a line of sight path, where beams usually
are unnecessary anyway, the terrestrial path is going to shift
the polarization of the transmitted wave anyway, so the 3 dB
theoretical handicap of the CP antenna isn't really real. In
fact, on scatter paths, they often work better than linearly
polarized antennas.

> All non FM yagis work well, M2 yagis seem to be the favorite today.

I also disagree that all non-FM yagis work well for satellites. On
2 meters, most long boomer style yagis are cut for 144.2 MHz, and
don't perform very well up at 145.9 MHz. Similarly, but not quite
as serious, long boomers for 70 cm are cut for 432 MHz, not 435 MHz,
and patterns, gain, and match won't be as good for satellite work.
The CP antennas are cut for the satellite segments, which means they
won't work quite as well for terrestrial band segments, but that's
usually not as important. You want ZRO-8 or better capability on

the satellite, and that's usually more demanding than any terrestrial path you'll be using. Sidelobes won't raise your effective system noise temperature much for terrestrial paths where the Earth is in the main lobe anyway, but they make a big difference when your target is against the cold sky, so you want that antenna cut and optimized for the satellite segment of the band.

>Stay away from yagis with a gamma match.

I agree with this.

>PS Why even consider a vertical yagi for FM repeaters? You'll spend less
>time on repeaters once you wet your mouth wet with Meteor scatter, Aurora,
>E skip, Tropo...ducting, and playing king of the mountain or grid :-)

Maybe, maybe not. Repeater Dxing is usually really bad form, but there is a surprising amount of simplex FM operation where a good beam can be a major assist.

I've used both stacked long boomers and CP antennas. My vote goes for the CP antennas if you're serious about satellites. The reduction in spin modulation is really significant. Having low sidelobes in the satellite band segment is really really significant. Being able to work terrestrial paths with either horizontal or vertical polarized stations is also a flexibility plus. The 3 dB loss, if it really exists on a given path, is worth the other advantages. I use KLM antennas, but the M2s are good too. Avoid the Cushcraft AOP-1 package. (Hell, avoid Cushcraft period except for their long boomers which aren't bad.)

I was listening to a radio interview program last night. The topic was an expedition made over the last few months to the arctic. A group of 6 people walked across the arctic ocean and north pole from Russia to Canada. During the show they said that they were able to communicate via the internet using the Argos and Healthsat satellites. I assume that Argos and Healthsat are packet store and forward birds because only data communications were mentioned. It was stated that a "platform" communications system was used. If anyone on the list can provide information about Argos or Healthsat it would be appreciated. What frequencies are used? Are they leo birds. What form of modulation is used? Thanks in advance.

>DAvid
It might be a good idea to get Dr Ralph Taggarts Weather sat book revision
4. It is available from the ARRL. It is the best single source out there.
The radio shack 2004/5/6/? are 75Khz bw in the wide mode. As you thought,
this is about twice as wide as you want. It will at least work(as oppossd
to 15Khz nb), but it doesn't work very well. The extra bandwidth lets in
a lot of extra noise and really trashes the images sn. I am getting a NOAA
12/14 wx sat station up. I will go on to goes after I get the bugs out of
the "simple" part. I am using a Pro2004 and am building an add on external
IF. I brought out the 10.7Mhz and 455Khz if to feed my R2000. I am going
use the IF chain out of an old commercial wireless microphone. It has about
45 to 50Khz bw with a fairly good noise floor. This weekend I will have
a turnstill with the preamp mounted at the antenna. If you like, I will let
you know if the increased signal(i am presently using a rs diskcone with and
old JFET preamp at the receiver(yeh I know that's not where it belongs))
gives a "good enough" signal to overcome the wide bw sn problem. I really
expect it not to.
BTW what software are you using? The JVFAX 7.0 is about the easiest that
I have found. I started out trying to use the SBDSP/IMdisp/APTCAP40 sequence
to record the wx sat pass with my SB, convert the vow(or wav?) to an "raw
binary" image, and then view it. So far I am missing something. Everything
goes great up until the viewing part. Oh well, that is a topic for another
post.

Date: 1995-07-13 00:00:00 UTC
From: aa679@ccn.cs.dal.ca
Message-ID: <DBMyr8.9BH@cs.dal.ca>
Source record: 24522

I was wondering, if there is any radio astronomy being done in PEI,CA.

If so, please let me know. There is a possibility of joint jrojects among
PEI, NB, and NS.

The program wants to know what you consider a reasonable minimum
elevation angle for the satellite's position in the sky. At 90 degrees
the satellite is directly overhead, at zero degrees the satellite is on
the theroetical horizon (no large objects blocking your view of the
horizon, perfectly symetcial Earth, no atmosphere. In practice the only
difference between the theroetical and actual is any large obstructions
(e.g. buildings, mountains, etc.

Typically I'll set my minimum elevation to zero - even though I realize
that the 'bad' (e.g. low elevation) passes aren't even worth going for.
But for many good passes I'll hear satellites as soon as the get above
the horizon.

>In article <NEWTNews.10202.805320693.pebbles@pi-user.pi.net> ,
blecourt@pi.net writes:
>Just kidding, I don't have any experience with a MAC !!!
>There are a lot of trackking programs, as you possibly know, for the PC.
>I use the programs traksat version 2.80 and pctrack version 1.1!!
>i'm very content with these program's

Dear schmuck,

who cares? This is *NOT* alt.I.hate.macs. This is
rec.radio.amateur.space. If you don't like Macs fine. But why do you
feel the need to waste net bandwidth by flaming the original request for
information for his preference with computers, without providing anything
useful?

Minimum elevation is a fairly standard parameter in most tracking
programs, including Traksat and PCTrack. You may not realize this - but
Mac and PC satellite tracking programs both obey the same laws of physics
and spherical geometry.

You could have provided useful information. Why didn't you?

P.S. For the record - I use both Macs and PCs - the Mac for applications
where it's better and the PC for applications where it's better. And my

personal preferences are Orbittrack and MacSPOC on the Macintosh, and
Traksat 2.80 on the PC.

1521. Shuttle Retransmission FAQ

Newsgroup: rec.radio.amateur.space
Date: 1995-07-13 00:00:00 UTC
From: hrsblackwell@stars.gsfc.nasa.gov
Message-ID: <hrsblackwell-1307951010240001@dimsdale.gsfc.nasa.gov>
Source record: 24529

Greetings,

This is an attempt to answer some commonly asked questions about the Goddard Amateur Radio Club's Shuttle Retransmission Activity. It was composed of bits and pieces of other documents as well as some new information. Unfortunately, I have lost some of the references to other authors who have contributed to this document. If you see something in this document that looks familiar, please let me know so I can give you credit for it.

This document is really a first draft and I expect it will expand. It can also be found on GARC's WWW server

URL: http://garc.gsfc.nasa.gov/www/garc-home-page.html

under Shuttle Retransmission.

Please send any comments or other questions to

jim.blackwell@gsfc.nasa.gov

I will try to answer them.

73

Jim Blackwell, N3KWU
Past President, Goddard Amateur Radio Club, Inc.

Shuttle Retransmission Fact Sheet
by Jim Blackwell, N3KWU
Last Update 06/30/95

I. History

Kindled by a desire to spread the excitement of America's space program and of the Space Shuttle in particular, members of the Goddard Amateur Radio Club (WA3NAN) and the Amateur Satellite Corporation (AMSAT) devised a plan to re-transmit live, air-to-ground audio over amateur frequencies.

After overcoming many hurdles, the Shuttle Retransmission effort began on August 31, 1983, 7 hours prior to the launch of Challenger on mission STS-8 on the local AMSAT/GARC 2 meter repeater by virtue of a waiver granted by the FCC for this purpose.

Retransmissions expanded to HF frequencies with the launch of STS-9 on November 28, 1983. Among many firsts for the Shuttle program during this mission was the first use of amateur radio from space by Mission Specialist Owen Garriott, W5LFL.

The success of this effort is shared by NASA, the Goddard Space Flight Center, AMSAT, hundreds of dedicated volunteer control operators, and by the world-wide support of the Amateur Community.

II. Frequencies

Retransmission of Shuttle air-to-ground audio from WA3NAN may be heard on the following frequencies:

Frequency (MHz)	Mode	Antennas
3.860	SSB LSB	N-S/E-W Dipoles
7.185	SSB LSB	N-S/E-W Dipoles
14.295	SSB USB	3-element Yagi
21.395	SSB USB	5-element Yagi
28.650	SSB USB	4-element Yagi
147.45	FM Simplex	Phased vertical

Where SSB is Single-Side-Band and LSB, USB indicate either Lower and Upper Side Band. A short-wave receiver possessing a Beat Frequency Oscillator (BFO) is needed to receive these transmissions.

III. Frequently Asked Questions About Shuttle Retransmissions

1. When Are You On The Air ?---There are several criteria that best determine when you will be able to receive Shuttle Retransmissions (not necessarily in order of priority):

A. While The Crew Is Awake---We are usually on the air from the time the crew gets its wakeup call (assuming the mission is not of the 24 hour variety) till the time they go into what is called "Pre-Sleep".

B. When Volunteer Operators Are Available---We have a limited pool of operators available during any single mission. The most difficult days and nights to schedule are usually on the weekends.

C. When Local Weather Permits---We are located in Greenbelt, MD just outside Washington DC. If you do not hear us and have the means to do so, check our current local weather. If there are thunderstorms (or other inclement weather such as a recent snowfall) currently in the area or predicted, we will likely be off the air until such weather has passed.

D. When Equipment Is Operational---Given the nature of our equipment, we typically have at least one major failure during a mission. Though we strive to get the failed equipment back on-line as soon as possible there will be downtimes for all bands.

2. How Soon Before Launch Do You Go On The Air?---We usually begin retransmissions about 1 hour before the predicted launch time.

3. Does Anyone Get Paid To Do This?---No. This is purely a voluntary activity by our membership as a public service to all Radio Amateurs.

4. What Is NASA's Involvement With The Club?---The Goddard Amateur Radio Club is one of many employee clubs sanctioned by the Goddard Employee Welfare Association (GEWA).

5. Your Shuttle Retransmissions Are Interfering With My Net...---We apologize and try to accommodate other Amateur Radio activities that our retransmissions may interfere with. This decision is usually made by the Control Operator on duty and/or the Shuttle Retransmission Director. The club leadership may also consider requests made , in writing, by groups or individual Radio Amateurs.

6. Why Do Other Hams Interfere With Shuttle Retransmissions---Contrary to popular belief, Radio Amateurs share the frequencies we are allotted by the FCC and our license class. All are free to use the frequencies whenever they want and may not even realize that they are on top of our signal. During missions, we ID the station frequently to let others know that the frequency is in use.

7. I Do Not Hear You In Anytown, Planet Earth, But I Know You Must Be On The Air, Why?---If you know that we are on the air and you cannot receive our signal and the problem is not with your equipment (receiver and antenna), then it is likely that signal propagation is not good for your geographic location.. Good propagation depends on a number of factors and varies with solar cycle (and storms), time of day, some atmospheric conditions, whether the given frequencies "skip zone" is such that the signal even reaches your location, and what direction and power we are transmitting. We welcome propagation reports since it tells us if it is indeed propagation, or that perhaps it is an antenna or transmitter problem at the station.

8. I Want To Send A Signal Report---You can send us a signal report to the addresses listed under "Contact Information". Please include a Self-Addressed Stamped Envelope (SASE) with appropriate postage if you wish to receive confirmation of your report (we use the QSL bureaus for requests made outside the US). Note that postage comes out of the club budget.

9. How Can I Get NASA TV---NASA Television offers the general public a front-row seat at mission launches and activities taking place in space during a mission, as well as informational and educational programming, historical documentaries, and updates on the latest developments in aeronautics and space science. NASA TV occasionally airs live coverage of SAREX activities. Programming is received by satellite dish or may be available through your local cable television network. NASA TV can be received from: Spacenet 2, Transponder--5, Channel--9, located at 69 degrees west longitude, at a frequency of 3880.0 MHz (C-band) with horizontal polarization (audio on 6.8 MHz).

For more information, contact: Technology and Evaluation Branch, Education Division, Code FET, NASA Headquarters, Washington D.C. 20546, or call (202) 358-1540.

10. Can I Retransmit Communications Between The Space Shuttle And Mission Control On Amateur Frequencies?---The FCC rules indicate that amateur stations are permitted to retransmit Space Shuttle air-to-ground

communications, provided that approval has been obtained from NASA (FCC Rules, Part 97.113 (e)).

In 1990, ARRL sought permission from NASA, on behalf of radio amateurs, to retransmit shuttle communications. The response from NASA's Office of Public Affairs encouraged such retransmissions, and indicated that the audio is public domain.

If you plan to rebroadcast NASA Shuttle audio, please follow these guidelines:

A. In keeping with good amateur practice and the FCC rules, shuttle audio retransmissions should be limited to missions of a specific educational purpose (non-commercial), such as those carrying the SAREX payload.

B. Retransmissions should be done manually (with a control operator present).

C. Occasionally, NASA audio may contain music. Amateurs should avoid, if at all possible, retransmitting music or any other prohibited transmissions not permitted by the FCC rules (FCC Rules, Part 97.113).

Please note however that the Shuttle audio retransmitted by GARC is not what one can receive from NASA TV. Rather, we get a direct feed from NASCOM. The difference is that this audio feed does not contain other coverage such as press briefings and mission status reports. This is significant because of restrictions on what are considered "permissible" transmissions by the FCC (see item C. above).

11. I Want NASA Goodies, Where Can I Get Them?---By "goodies" I refer to patches, photos, information related to the Space program, NASA centers, GSFC, projects and so on. Rather than send such requests to GARC, we prefer that you send your queries to the GSFC Visitor's Center at:

GSFC Visitor's Center
Code 130.0
NASA Goddard Space Flight Center, Greenbelt MD 20771

12. Can I Become A Member?---Membership is presently limited to GSFC Civil Servant and Contractor employees and their immediate families. We do extend membership to those outside GSFC provided they assist us with our public service activities including Shuttle Retransmission. We are working to allow other levels of membership to include a "Contributing Membership" that would allow interested individuals to receive our monthly newsletter and help to offset the cost of our activities.

IV. Contact Information

You can contact the Goddard Amateur Radio Club at the following address:

Goddard ARC/WA3NAN
P.O. Box 86

Greenbelt, MD 20768-0086
(301) 286-6673 (during missions)

V. WA3NAN Club BBS

The Goddard Amateur Radio Club, Inc. maintains a Bulletin Board System (BBS) which is accessible by way of the Internet, modem and packet radio. The BBS contains areas with information on the club, mail distributed by the Amateur Satellite Corporation BB (AMSAT-BB) listserver, SAREX bulletins and Space Shuttle mission information. During Shuttle missions, users can also access Keplerian Orbital Elements (Keps) which are generated by the club based on information generated by NASCOM at GSFC (these orbital elements are read over-the-air by our volunteer operators).

The BBS is accessible by the following means:

1. Internet: telnet to wa3nan.gsfc.nasa.gov (128.183.105.17)
2. Telephone: (301) 286-4137 (up to 14.4 kbaud supported)
3. Packet Radio: WA3NAN on 145.090 MHz in DC area.

Just follow the login instructions. Note: Full access to the BBS is limited to members of the club.

VI. GARC World Wide Web (WWW) Server

The Goddard Amateur Radio Club, Inc. maintains a WWW Server containing a wide variety of information about the club, its activities, as well as links to other Amateur Radio resources. To access this server, you must have an Internet connection and a WWW browser such as NCSA Mosaic, Netscape Communications Corporation NetScape Navigator, or the text-based Lynx. The URL address is:

http://garc.gsfc.nasa.gov/www/garc-home-page.html

Try spacelink.msfc.nasa.gov ftp, telnet, www, gopher, whatever.
it's under hot topics, current mission STS-XX, keplerian elements,
or something like that. If you nt keps for other sats, check
instructional materials, software, ibm pc, satellite tracking, keps,
or something like that.

1528. Two-Line Orbital Element Set: Space Shuttle

Newsgroup: rec.radio.amateur.space
Date: 1995-07-14 00:00:00 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.805757408@dolphin>
Source record: 24536

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (334) 409-9280, and are updated daily (when possible). Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current elements for the current shuttle mission are provided below. The Celestial BBS may be accessed 24 hours/day at speeds up to 28,800 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily), shuttle elements, and some documentation and software are also available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

1529. Two-Line Orbital Element Sets (TLE639)

Newsgroup: rec.radio.amateur.space
Date: 1995-07-14 00:00:00 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.805757661@dolphin>
Source record: 24537

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (334) 409-9280, and are updated daily (when possible). Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at speeds up to 28,800 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily) and some documentation and software are available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space.news and rec.radio.amateur.space. This week's elements are provided below.

ARGOS is a commercial French teletry store and forward system, carried
on the US NOAA meteorological satellites. It's commonly used in
conjunction with buoys, tide gauges, and the odd whale to send vital
data at a low rate. ARGOS platforms (whales etc) can generally be
located to a precision of roughly 500 metres, sometimes better sometimes
worse. The system is commercial in the sense that you pay for access
by each platform (an activation charge if you like), plus I gather that
you pay for data traffic. While appearing commercial, ARGOS supports
an awful lot of very important science.

And no, ARGOS is not the same as the SARSAT/COSPAS system on NOAA.

As for NOAA - it is a low earth orbit sun-synchronous satellite.

Healthsat is based on the UOSAT bus. More than that and I'm afraid I'm
stuck. Someone can surely answer this one ??

A good transverter with a good HF rig (both with high intercept)
will beat a VHF all mode hands down. So it depends very much on the
10 metres all mode rig you have in mind.

All the places previous mentioned usually have Shuttle elements, but they're not always up to date. The best place (IMHO) is the Shuttle Elements Mailing List, which is also at <http://www.cts.com/browse/garym/elements>.

The reason it's better is that the Shuttle Elements Mailing List has many sources including all known ftp and Web sites with elements and it constantly scans them all for the latest elements and updates the mailing list subscribers and the web page automatically.

SB SPACE @ ARL $ARLS011
ARLS011 Shuttle Astronauts On-The-Air

ZCZC AS90
QST de W1AW
Space Bulletin 011 ARLS011
From ARRL Headquarters
Newington, CT July 14, 1995
To all radio amateurs

SB SPACE ARL ARLS011
ARLS011 Shuttle Astronauts On-The-Air

NASA astronauts successfully setup the Amateur Radio equipment aboard the Space Shuttle Discovery on Friday morning. During a test pass, volunteers at the Johnson Space Center Amateur Radio Club station, W5RRR, made contact with the crew as the shuttle orbited over Houston, Texas. Astronaut Don Thomas, KC5FVF said ''Tell everyone hello and thanks to all of the SAREX volunteers, who are doing really great work.'' Don began calling CQ right after the test pass and began working other stations.

The crew may make random contacts with many amateurs throughout this mission, which ends on July 21. The educational nature of these contacts makes this activity exciting for amateurs and school children around the world. To avoid causing interference to other stations, SAREX participants should operate only when the shuttle is within range and the astronauts are on-the-air. Non-participants are asked to be patient, as shuttle passes are short and usually occur only a few times each day.

The following frequencies can be used to make contact with the shuttle astronauts. The crew will use separate receive and transmit frequencies. The worldwide FM voice downlink is 145.55 MHz. Please do not transmit on the shuttle's downlink frequency. The downlink is your receiving frequency. The uplink is your transmitting frequency. The voice uplink frequencies are 144.91, 144.93, 144.95, 144.97, and 144.99 MHz. In Europe, the uplink frequencies are 144.70, 144.75, and 144.80 MHz. Look for Don, KC5FVF and Mission Specialist Nancy Sherlock Curie, KC5OZX. The crew may also operate packet in an ''unattended'' mode, allowing amateurs to make contacts with the shuttle's ROBOT station when the crew is working or sleeping. The FM packet downlink frequency is 145.55 MHz. The packet uplink frequency is 144.49 MHz. The ROBOT call sign is W5RRR-1.

Send reports and QSLs to ARRL EAD, STS-70 QSL, 225 Main Street, Newington, CT 06111-1494, USA. Include the following information in your QSL or report: mission STS-70, date, time in UTC, frequency and mode (FM voice or packet). In addition, you must also include a SASE using a large, business-sized envelope if you wish to receive a card. The Sterling Park Amateur Radio Club in Sterling, VA has generously volunteered to manage the cards for this mission.

Thanks to the SAREX Working Group for the preceding information. The Shuttle Amateur Radio EXperiment is sponsored by AMSAT, ARRL and NASA.

I'm a shuttle newbie. Where do I get the Keplarian Elements for load into
STSORBIT to track the shuttle?

Easiest way is from AMSAT. Try
http://www.qualcomm.com/amsat/AmsatHome.html They have lots of data.

What type demodulator are you using? I had trouble with JVFAX 5/6/7 all
locking up when I was using the "simplest" opamp demode with the
"hamcom" vco front end. As long as I didn't try to save to disk it was
great. But trun on the save or quick save and it would often lock up.
I am using a A&A demod feeding it to the printer port, and the program
has not locked up for three evenings. I was even able to restore
all the device drivers that I'd had to remove.
If you have a SB card you might check out the SBDSP program, it at
OAK.SIM or what ever. you will also need the APTCAP40.?(you can get
that one from AMSAT's www. I have yet to get the SB setup to work.
I have had the thought that my signal just is not "clean" enough yet.
Terry

However, if you analyze the entire system including a satellite like
Oscar 13, you find that the 2M rig isn't that critical. Since a mast
mounted preamp is used on receive, the noise figure of the receiver isn't
a big factor. Similarly, the satellite doesn't exactly have a huge
dynamic range, so high dynamic range is only needed in dealing with
terrestial interference, which may not be a problem.

Of course, some people do have big local signals to deal with.
A homebrew single conversion or even direct conversion receiver
will do even better than a transverter/top-of-line amateur
transceiver. Building your own makes interfacing with transverters
much easier.

1538. Schenectady, NY SAREX Contact 7/17/95

Newsgroup: rec.radio.amateur.space
Date: 1995-07-14 00:00:00 UTC
From: "Stephan M. Anderman" <sanderman@delphi.com>
Message-ID: <RbPiok8.sanderman@delphi.com>
Source record: 24546

FOR IMMEDIATE RELEASE

Seven students from the fourth, fifth, and sixth grade of Schenectady's Pinewood Elementary School will have the opportunity to talk directly to astronauts aboard the space shuttle Discovery. The Schenectady Museum Amateur Radio Association will host SAREX, the Shuttle Amateur Radio EXperiment on Monday. The students won the opportunity to ask questions of the shuttle crew in an essay contest sponsored by the school and the Schenectady Museum & Planetarium. The SAREX payload is flying aboard the STS-70 mission launched Thursday from the Kennedy Space Center in Florida.

The Schenectady Museum Amateur Radio Association has worked for several years to bring this educational program to the Capital District. SMARA Chairman Peter Harvey noted that only selected clubs and educational facilities receive this opportunity. "For this flight, the Museum is one of only eight groups to be offered the chance to bring amateur radio and the space program into the science classroom curriculum." Six of the other participating schools are in the United States and the other in Argentina.

The Shuttle Amateur Radio Experiment is sponsored by the American Radio Relay League, the national fraternal organization of "ham" radio operators of Newington, Connecticut, AMSAT - the Radio Amateur Satellite Corporation, and the National Aeronautics and Space Administration, and supported by the Federal Communications Commission. NASA's intent in making astronauts available for SAREX operations is to involve the largest possible number of people, particularly youngsters, in technology and the US Space Program with the help of amateur radio. SAREX also allows astronauts to converse with their families and other hams around the world during their non-working hours in space.

Many of the astronauts in both the US and Russian space programs are avid ham radio operators. Dr. Norman Thagard, who returned from the Russian MIR space station last week, kept in close contact with students here in the US via amateur radio. This same ham equipment helped facilitate communications for the historic docking of MIR and the shuttle Atlantis late last month.

Amateur radio has been flying aboard shuttle missions since 1983 when Dr. Owen Garriott was the first to talk to earthbound amateurs. Slow scan amateur TV (ATV), computer packet messaging systems, and conventional FM voice communications have all been successfully used by astronaut-hams to enlighten school children.

The seven Pinewood students, two boys and five girls, will
ask their questions on a special ham radio station at the Museum.
Licensed members of the STS-70 crew include Mission Specialists
Donald Thomas, KC5FVF, and Nancy Jane Sherlock-Curie, KC5OZX.
Additional members of the Discovery crew, Commander Tom Henricks,
Pilot Kevin Kregel, and Mission Specialist Mary Ellen Weber may
also be available to answer student questions during the planned 17
minute contact, currently scheduled for Monday at 10:10 AM EDT.

> Todd Owen (KE4UDN) Virginia Commonwealth University
>---

Depends on the 10M rig. Most are not very sensitive (0.3 to 1.0 uV
for SSB), however a down converter from 70cm or 2m will probably have
sufficient gain to overcome this (at least in the 0.3 uV case). The
next problem is trying to receive at the same time one is transmitting
(full duplex operation) which is generally not possible with a 10m
transceiver. For optimum satellite work, especially with the Molniya
orbit (high altitude, polar) satellites, it is almost mandatory to be
able to hear your own downlink to properly adjust power and antenna
aiming on the uplink. Seperate transceivers on 2m and 70cm take care
of this as do the transceivers set up for cross band duplex for satellite
work (the very expensive 70cm/2m base stations by Yaesu, etc.)

Lastly, uplink is generally on the opposite sideband from the downlink,
ie USB up would come down as LSB. The typical 10M rig won't do this.

Recommendation: Use the 10M rig with an up or down converter for either
70cm or 2m and use a seperate multimode 2m or 70cm rig for the remaining
band.

Posting-Frequency: posted on the 15th of each month

This message describes the rec.radio.amateur.*, rec.radio.cb, rec.radio.info, and rec.radio.swap newsgroups, as well as their Internet mailing list counterparts and complements. It is intended to serve as a guide for the new reader on what to find where. Questions and comments may be directed to the author, Jay Maynard, K5ZC, by Internet electronic mail at jmaynard@admin5.hsc.uth.tmc.edu. This message was last changed on 31 October 1994 to add the discussion of non-Usenet mailing lists and streamline most of the history discussion, and to change the moderator information for rec.radio.info.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions were held on the mailing list, and sent to the mailboxes of those who had signed up for it. When the Usenet software was created, and net news as we now know it was developed, a newsgroup was created for hams: net.ham-radio. The mailing list and the newsgroup were gatewayed together, eventually.

Over the years, as the net grew, the volume of discussion became progressively higher. First one by one, and then as part of two reorganizations, what was once one group became many. In the process, developments elsewhere on the net were reflected in the groups as they were created, most notably the change to place all of the ham radio groups in one hierarchy.

The collection of newsgroups continues to grow as more people join the net, and as more topics of discussion gain volume, I expect to see more groups be created as well. This follows what is happening on the rest of the net.

Nearly all of the radio newsgroups have corresponding mailing lists, the notable exception being rec.radio.swap. There are also a few mailing lists that don't have newsgroups.

The Current Groups
==================

It's important to post messages to the group that's appropriate for them, and not to the groups that aren't. The whole idea of having different

newsgroups is so that folks who aren't interested in, say, homebrewing, don't have to wade through messages about homebrewing on the way to read about Field Day. Posting appropriately is just good etiquette.

The rec.radio.amateur.misc group is the catchall. It is what rec.ham-radio was renamed to during the first major reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, was removed on September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there. To answer a frequently asked question: No, there is no mailing list that goes along with this group. If you can't read Usenet news directly, you're out of luck.

The group rec.radio.amateur.policy was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate - it's now legal to order a pizza on the autopatch, if you're not in the pizza business - as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The group rec.radio.cb is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently David Dodell, WB7TPY. The email address for submissions to the group is rec-radio-info@stat.com. Inquires and other administrivia should be directed to rec-radio-info-request@stat.com. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups rec.radio.amateur.antenna, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

Mailing Lists

In addition to the mailing lists that mirror the Usenet newsgroups, there also are a few that stand alone. These cover specific areas of ham radio, and discussion is focused on just those areas.

The cq-contest mailing list is for discussions of contesting in ham radio. To join, send email with the word "subscribe" on a line by itself to cq-contest-request@tgv.com.

The DX mailing list covers the finer points of DXing. This one is also joined by mailing "subscribe" on a line by itself, this time to

dx-request@unbc.edu.

There's also a VHF mailing list, for VHF operators of the weak signal persuasion. You can join this one be sending "subscribe vhf" on a line by itself to vhf-request@w6yx.stanford.edu.

All of the following mailing lists are sponsored to the Boston Amateur Radio Club, as well as some others of local interest. Thanks to N1IST for the information.

qrp-l: This is the qrp mailing list, previously maintained by Bruce Walker at Think.com. It is for discussions about the design, construction, and use of qrp (low power) radios and related equipment.
arrl-ve-list: This is a one-way list, run by Bart Jahnke of the ARRL VEC, for announcements to VEs and VE teams.
w1aw-list: ARRL bulletins, news, and information
newsline-list: Redistribution of Amateur Radio Newsline
letter-list: Redistribution of the ARRL Letter
fox-list: Fox hunting and Radio Direction Finding
fieldorg-l: ARRL field organization discussions
ham-tech: Technical discussions and questions about Amateur Radio
arrl-exam-list: amateur radio license examinations scheduled in the US and in some foreign areas.

To sign up or inquire about these lists, send mail to listserv@netcom.com with the following in the body (subject is ignored) of the message.
<listname> is the name of the list to subscribe to.
To subscribe: subscribe <listname>
To unsubscribe: unsubscribe <listname>
For more information: help
To post (to the two-way lists), send your message to <listname>@netcom.com

Please do NOT send subscription requests to the mailing lists themselves; that doesn't work very often, and is very annoying to those on the list. Also, please keep your electronic mail address current with any mailing lists you subscribe to, as dealing with returned email is a nuisance for the person maintaining the mailing list.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while

still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

Cross-posted to: rec.radio.amateur.misc,rec.radio.scanner,rec.radio.amateur.space

I am going to be visiting Colorado during the current shuttle
mission (STS-70) and would like to know of any frequencies
that are NOT short wave that I might hear the shuttle
transmissions rebroadcast on.
The areas I will be in are Ft. Collins, Denver, Colorado Springs
and all points in between (along I25 that is).
Any help would be greatly appreciated.

Usually the 145.46 and 147.225 rebroadcast Nasa Select.
The 5.46 is in Boulder and the 7.225 is in Denver, you'll
probably catch the 5.46 most of the way from Cheyenne through
Denver and beyond I am sure.

From: trinel@crl.com
Message-ID: <3u817d$e09@crl4.crl.com>
Source record: 24551

Hello, my name is Noah Edelson and I am working on a project involving programming a 3d representation of a starmap. However, I need either some sort of coordinate system (xyz) to map them. If anyone has a nice 2d starmap scanned, I would be deeply appreciative if you would contact me.

137-ish MHz _IS_ 2-Metre band. This is similar to 31-Metre band for frequencies between 9400 and 9900 KHz in the shortwave frequencies. Get it?

1545. DL0ART/am balloon launch #2 planned

Newsgroup: rec.radio.amateur.space
Date: 1995-07-15 00:00:00 UTC
From: Oliver Welp <welp@uni-muenster.de>
Message-ID: <3u8kkp$1ifk@majestix.uni-muenster.de>
Source record: 24553

The Nienberge Amateur Radio Group (Germany) plans another "small" balloon launch on sunday, 07-16-95.

We planned to have another emergency beacon with our regular balloon equipment, and it now is ready for a launch. Since we have some (smaller) spare balloons, we plan to do a launch with only this rig: 2 m beacon - no data, no remote control, no gas valve; just launching and parachuting (hopefully) "home" after bursting.

Purpose of launch:
Testing emergency beacon and practicing DF (especially coordinating teams).

Planned ARTOB launch 07-16-95:

Launch: # 2
Launch date 07-16-95
Launch time: 1200 UTC
Launch site: Nienberge near Muenster, Germany, JO32SA
Call sign: DL0ART/am
QRG/mod.: 144.991 MHz F1A beacon: call sign and info in cw, in between freq shift slow (- - - - - - = balloon lifts) or fast (..... = balloon is descending)
Power: 100 mW
Antenna: groundplane
Diameter ballon: ca. 3 ft
Gas: hydrogen
Parachute: ca. 5 ft

Talk back via repeater Muenster, DB0PD (R 84). Reports are welcome, please call DL3YBQ or DL9QJ. Or send QSL via bureau, we now have our own QSL cards for the balloon.

Any suggestion or response is always welcome!
Best 73,
Oliver

>pictures of clouds using various radar technologies and transmit them on the
>2 metre band.

Am I ??? That's news to me...

For a start, the NOAA satellites are used to image a variety of targets.
Some people like looking at clouds, but the land imaging applications
are just as numerous.

And no, NOAA doesn't use radar technologies (good grief...).

And no, the signals do not come out on the 2 metre band - they come out
somewhat lower (137 ish MHz).

well, i am useing the HAMCOMM3 interface <both RX and TX>
i have no problems with self testing SSTV anf HAMfax but it's just when i get
a sat., overhead and start rx....it goes pooff and locks up.

i haven't done to much due to the play lighting i'm doing and the heat over in
the east, but i'll look for this aptcap program, and see what it does

1552. Schenectady, NY SAREX Contact on WA3NAN

Newsgroup: rec.radio.amateur.space
Date: 1995-07-16 00:00:00 UTC
From: "Stephan M. Anderman" <sanderman@delphi.com>
Message-ID: <5nAC4ZL.sanderman@delphi.com>
Source record: 24466

FOR IMMEDIATE RELEASE Page 1 of 1

NASA and the SAREX Working Group have announced that the scheduled amateur radio contact between astronauts aboard the space shuttle Discovery and students in Schenectady, New York will be carried on WA3NAN by the Goddard Amateur Radio Club in Greenbelt, Maryland. WA3NAN retransmits air-to-ground and ground-to-air audio on the amateur HF bands for all shuttle missions carrying the SAREX (Shuttle Amateur Radio EXperiment) payload.

The scheduled SAREX contact between Discovery mission STS-70 and students at the Schenectady Museum & Planetarium will take place Monday, June 17th, at 1450 UTC (10:50 AM EDT). The Schenectady Museum Amateur Radio Association, WB2CRZ, will also carry the question and answer session locally in the Albany/Schenectady/Troy area on its KA2QYE repeater on 147.375 MHz. The contact will also be carried by tape delay Monday at 8:15 PM on 147.375 and on the Capital District Satellite Net Monday at 9:15 PM on the WA2OQE repeater in Troy on 145.33 MHz.

WA3NAN can be heard on the amateur HF frequencies 3.860, 7.185, 14.295, 21.395, and 28.650 MHz single sideband (SSB) and locally in the Washington, DC area on 147.45 MHz FM. Propagation conditions, time of day, and your location and receiving equipment should guide your choice of the best received signal.

The seven young people who will be asking questions of the shuttle astronauts are all students at Pinewood Elementary School (Mohonasen School District) in Rotterdam, NY. The students were chosen based upon the results of an essay contest, held this past Spring, and sponsored jointly by the school and the museum.

35 entries were received and judged by school faculty and museum staff. The seven students (2 boys and 5 girls) scheduled to participate are third grader Brendan French, fourth graders Lisa Rothman, Shannon Campbell, and Kate Nichols, and fifth graders Kathleen Komarinski, Susie Slater, and Brandon Tuchovsky.

The students participated in a "dress rehearsal" at the museum in June, a few days before the initial launch date was scrubbed by NASA due to the now-famous "woodpecker problem". The contact will take place from the "Space Shuttle Schenectady", a scale mock-up of the NASA shuttles, in the museum rotunda, adjacent to the planetarium theater.

Amateur licensed shuttle crew members aboard Discovery include Mission Specialists Donald Thomas, KC5FVF, and Nancy Jane Sherlock-Curie, KC5OZX, who received her license just a few days before Thursday's launch. Additional members of the Discovery crew are Commander Tom Henricks, Pilot Kevin Kregel, and Mission Specialist Mary Ellen Weber.

Like the long wave band is close to medium wave ? Oh, I get it...
It makes absolutely no sense at all.

2 metres means either 144-146 or 144-148 MHz, depending on where you live
in the world. The 137 MHz band is a separately recognised band. Attempting
to muddy the distinction puts amateurs in a difficult position.

Get it ???

Just to show that working the shuttle is not all that hard...

At 14:09 UTC I heard the shuttle switch from packet to voice, so I
switched modes and threw out my call after they called CQ.

I was rewarded with a very nice contact with KC5FVF.

This was accomplished with 25 watts to a 6 dB gain dual band vertical
about 20 ft. up. Very common gear for most hams.
D
Just be persistant, and with a little luck the shuttle can be worked.

Tom,
Thanks for the report! Incourageing news for us low powered hams. I have
hit Mir with as little as 4 watts on 2
occasions. Once with the bbs (got a busy message back) and once with
R0MIR but I lost her before my message got back into their tnc. I use a
ringo ranger 2 vertical. Heard Nic 2 or 3 days ago but I didn't realise
it was him until it was too late. I could have talked to him!
What did you talk to Don about?

Hello, name here is Steve. I was down to St Marys University a couple of
weeks ago to pick up some ham gear for our club. Although I don't remember
the Profs name, I was shown a whole lot of radio astromony gear. Im sure if
you contacted St Marys you could find out more. Its not PEI but is is close.

While using the Hamcom vco with the simplest converter, JVFAX would lock
up about 1 out of 3 attemps. I removed all unneeded device drivers,
turned break on,. It seemed to work best with a smartdrvice cache set up
to sped up disk write(I think the cache allows the cpu to hand off the
disk write to the dma controller). I was using MSDOS5.0 on a 20Mhz
80386. I recently got a 4086dx2 66MHz mother board. I thought that the
higher speed would help. And it did, a little bit. I tried XMS, EMS,
DOS HI DOS LOW and anyting else that I could think of. While going nuts
with this part of the project, I decide to dig out my old A&A wefax demod
board. Is is designed for NOAA birds and talks via an 8bit a>d..
After nearly giving up on trying to get JVFAX to listen to the A7A via
printer port, I decided to use the printer status bits, they comprise a
5bit input. Bit 7 has to be inverted!. With this setup I get 32 levels
of grey. Even though it was too hot to errect a proper antenna this
weekend, I did get a crossed horizontal dipole array up about 40', with
the preamp at the the top. I simply have the pipoles paired wiht an
opposing set, I also do not have the proper reflecting elemnets in place
yet.
Even so it is about 20 time better that the diskcone. I get pretty good
pictures from about 10 degrees above the horizon, with only a few deep

fades as it goes over head.
I have not been able to get more than sync pulse usnig a 15Kc NB mode.
And I have yet to get the SBDSP/APTCAP40 method to work. I am working
tonight, so I am going to try capturing the a "wav" of the pass. The
signal is now a lot better than before, so that might be the trick.
The method is to use the SB "vrec." to capture a pass, process the "wav"
file wiht the SBDSP and view the result wiht either RG8 or aptcap40.
I will let you know if anyof this works.
Terry

1560. QSO with STS-70

Newsgroup: rec.radio.amateur.space

A friend of mine (Jules, KK6TR) contacted astrounat Don Thomas (KC5FVF) on Monday, July 17 at about 0850 (PST). He interchanged call signs with the astronaut who acknowledged his contact. As you would expect he (my friend) was very thrilled and he hopes to get a QSL card from the SAREX people. He asked me to ask to this group's community on the procedure to get a QSL card from this shuttle mission. Anyone knows the procedure? Thanks.

Rafael (KE6JSR)

PS: Jules lives in Oakhurst, CA (near Yosemite NP). The total contact lasted less than 20 seconds, he told me.

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (334) 409-9280, and are updated daily (when possible). Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current elements for the current shuttle mission are provided below. The Celestial BBS may be accessed 24 hours/day at speeds up to 28,800 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily), shuttle elements, and some documentation and software are also available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

1564. Schenectady SAREX Contact a Success!

Newsgroup: rec.radio.amateur.space
Date: 1995-07-17 00:00:00 UTC
From: "Stephan M. Anderman" <sanderman@delphi.com>
Message-ID: <R-IioHa.sanderman@delphi.com>
Source record: 24472

FOR IMMEDIATE RELEASE Page 1 of 1

Seven young people from the Pinewood Elementary School in Rotterdam, New York had an opportunity to ask questions of Pilot Kevin Kregel during a scheduled contact with the space shuttle Discovery. The SAREX (Shuttle Amateur Radio EXperiment) contact between Discovery and the students, gathered in the Schenectady Museum & Planetarium at a scale mock-up of the NASA shuttles, occurred Monday, June 17th, at 1453 UTC (10:53 AM EDT).

Members of the Schenectady Museum Amateur Radio Association, WB2CRZ, facilitated the nine minute contact through amateur radio, telebridge, and NASA satellite communications channels. Hans Van Der Groendaal, ZS5AKV, near Johannesburg, South Africa served as the amateur tracking station for the contact.

Pilot Kregel answered questions from the 5 girls and 2 boys about living and sleeping in microgravity, energy conservation, shuttle experiments, mission objectives, and the safety of space travel. The students were selected based upon the results of an essay contest, held this past Spring, and sponsored jointly by the school and the museum.

The contact was well covered by the news bureaus of the three major TV network affiliates, two regional and one local newspaper, two news radio stations, and the Associated Press. The STS-70 mission, carrying Kregel, Commander Tom Henricks, and Mission Specialists Donald Thomas, KC5FVF, Nancy Jane Sherlock-Curie, KC5OZX, and Mary Ellen Weber is scheduled to land Friday at the Kennedy Space Center in Florida.

Kory:

Your questions are typical of those that everyone asks as they think through setting up a LEO (low earth orbit) ground station. You are asking the right questions, so you are on the right track. I have not tried an eggbeater however I would like to. I would like to find the perfect LEO, non-az-el-rotor ground station combination. Most "omni" antennas are not omni in 3 dimensions but in 2. This is fine for signals coming from the direction of the horison. Of course satellites don't always come from the direction of the horizon. However their signal is most attenuated when they are near the horizon. Therefore an antenna with some more gain on the horizon is benificial. An "omni" antenna with 8 to 11 db gain will do very well for passes of low elevation and the low elevation portions of higher passes but will loose the signal above 40 to 60 degrees even though the satellite has the strongest signal at this point in the pass. I suppose the egbeater will perform better at these higher elevations than a gain omni which will have a gain of less than 1 at high elevations. The eggbeater will perform poorly at low angles. When setting up a ground station an important question is "how much of the horizon can I see?". Here in eastern Tennessee the mountains and high trees can result in much or little very little view of the horizon. In this case an antenna such as a quadrifilar helix with a high gain at higher elevations would bea good choice. In Kansas, or on a mountain top the choice would be different.

As for preamps, a mast mounted preamp is a must for 70cm. At 70cm the attenuation even in very good coax is unacceptable if you have more than a short run of coax. Get a copy of the satellite experimenters handbook and work some of the antenna/preamp/coax equasions. They are tedious but very educational.

I have more ideas on the perfect LEO groundstation however I have been summoned for dinner (and it looks and smells exceptionel) so will write more if coaxed.

1570. Two-Line Orbital Element Set: Space Shuttle

Newsgroup: rec.radio.amateur.space
Date: 1995-07-18 00:00:00 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.806109731@dolphin>
Source record: 24478

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (334) 409-9280, and are updated daily (when possible). Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current elements for the current shuttle mission are provided below. The Celestial BBS may be accessed 24 hours/day at speeds up to 28,800 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily), shuttle elements, and some documentation and software are also available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

1572. Re: QSO with STS-70

Newsgroup: rec.radio.amateur.space
Date: 1995-07-18 00:00:00 UTC
From: Bob Winingham <kc5ejk@onramp.net>
Message-ID: <3uf0gc$d2e@news.onramp.net>
Source record: 24480

>>> He asked me to ask to this group's community
on the procedure to get a QSL card from this shuttle mission. Anyone
knows the procedure?

The Sterling Park Amateur Radio Club, Sterling Park, Virginia has
generously volunteered to distribute the QSL cards for this mission.
Send reception reports and QSLs to ARRL EAD, STS-70 QSL, 225 Main Street,
Newington, CT 06111, USA. Include the following information in your QSL
or report: STS-70, date, time in UTC, frequency and mode (FM voice or
packet). In addition, you must also include a SASE using a large, business
sized envelope if you wish to receive a card.

[Info via Frank H. Bauer, KA3HDO for the SAREX Working Group]

1573. SAREX school contact schedule list wanted

Newsgroup: rec.radio.amateur.space
Date: 1995-07-18 00:00:00 UTC
From: au156@yfn.ysu.edu
Message-ID: <3uf9an$kj8@news.ysu.edu>
Source record: 24481

Does anyone have or know how to get an accurate list of SAREX school contact schedules? I just missed the one for NY state on Monday morning posted here.

I'd like to have my little niece and nephew listen in on the kid's questions.

A contact I heard by chance on WA3NAN was pretty fun to listen to.

Hank, N1LTV

: We are interested in 2 meter FM packet during the Perseids shower.

We would like to try the MS program that is available on many ham radio CD-roms and elsewhere. If you are interested and live within 500-1000 miles of Lincoln, Nebraska (EN10), or are generally interested in establishing protocols, frequencies, etc. for trying this out, please respond here or e-mail us. Anyone out there who has tried this or similar procedures?

Ok, I have a pro-2026 converted for home and a basic 'coat-hanger'
with a preamp at the back of the house. I get fairly excellent
pictures (with a few minor dead spots) with my sound board hooked up
and a little program. (.wav converter). I do experience the noisy
signal but only on really bright clouds and reflections of the sun off
of Hudsons Bay. Just about anything will work as long as the signal is
good. Preamp a must!

Is there someone who can tell me what the close approach frequency
for Shuttle/Mir docking missions is? I saw a generalized comment
someplace that it is in the 121 Mhz area.

Kerwin

From: andy@mustang.aero.org
Message-ID: <3uomv1$3e@news2.aero.org>
Source record: 24491

Noah,
Don't know the level of understanding you've got on these things, so no offense if I describe this too basic, ok?

Most starmaps are expressed in a spherical coordinate system. That is, you get two angle measurements to describe its position relative to earth. Some star catalogs include a distance measurement, and most (if not all) include star magnitudes ("brightness"). The two angles you get are right ascension and declination. These are based in a non-rotating earth-fixed (probably more accurate to call it solar system fixed, although the difference is pretty much negligible) coordinate system. This coordinate system is can be thought of as a latitude & longitude system for the stars.

What you can get out of these catalogs is a "celestial sphere", which can be visualized as a 3D planetarium. If you're trying to get a spatial starmap that would show distances away from the earth as well as their angular position, you might have trouble scaring up a fully populated database (I know some detailed subsections of the sky have been done).

You can find varied levels of detail star catalogs at the NASA ftp sites. Check the sci.space FAQs for their addresses.

Hope this helps,

Andy

1584. Colorado Repeater/ATV Balloon Launch.

Newsgroup: rec.radio.amateur.space
Date: 1995-07-21 00:00:00 UTC
From: au156@yfn.ysu.edu
Message-ID: <3up314$k1g@news.ysu.edu>
Source record: 24492

CENTRAL COLORADO REPEATER/ATV BALLOON LAUNCH

The Central States VHF Society is having a meeting in Colorado Springs on the weekend of July 29-30, 1995. In conjunction with this event, EOSS (Edge of Space Sciences) will launch a demonstration flight from the Navsys Corp. in Monument, CO.

Region: Central Colorado

Date/Time: July 30 / 9:00 AM MDT, 15:00 UTC

Location: Monument, Colorado (20 miles north of Colorado Springs)
Site Coordinates: 39.09 North Lat. 104.87 West Long.
ATV: 426.25 MHz AM (1 watt output) NTSC color video
VHF/UHF Repeater: 446.000 MHz FM Input 147.555 MHz FM Output (note change as of 7/16/95)
Beacons: a) 147.555 MHz carrier from repeater always on; (periodic Morse ID audio on FM)
b) 144.34 MHz Morse ID audio on FM (periodic; frequency shared with packet telemetry)
Telemetry: 144.340 MHz FM (1 Watt output) - AX.25, 1200 baud mostly plain english text; includes APRS position data string.
Foxhunters: Pikes Peak FM Association, 448.450 MHz (tentative)

The primary payload will be the Rocky Mountain Radio League's crossband repeater. In addition, tests will be conducted on the GPS system's software. A new cutdown device will also be evaluated this flight. It utilizes a pager receiver, retuned for 2 meters, interfaced with a "basic stamp" microcontroller for decoding DTMF tones.

This balloon will ascend to approximately 95,000 feet where the flight will be terminated by sending a cutdown command to the payload. The duration of the flight should be around 2 hours with the balloon reaching its maximum altitude at approximately 1 hour 30 minutes elapsed time.

Reception of both the 2 meter and ATV signals is possible to 400 miles out and beyond when the balloon gains altitude. All interested

amateurs in Colorado and bordering states with equipment as simple as a 2 meter HT are encouraged to listen in for the steady output of the cross-band repeater on 2 meters with ID, and the ID from the packet system at 144.34 Mhz.

Automatic Position Reporting System (APRS):

EOSS Shuttle controllers now beacon on the packet telemetry frequency with an APRS position string. If you are running APRS you should be able to graphically track the progress of the flight on the "CODENVER.MAP" map file.

The Shuttle is not a TNC-equipped packet station. In order to minimize possible interference with hams in their areas, all APRS users tracking the flight should turn off their APRS position beacons (more packet/APRS info at EOSS web site). Thanks!

For additional launch data and general EOSS information:

1590. Help the Astronauts Memorial Foundation

Newsgroup: rec.radio.amateur.space
Date: 1995-07-23 00:00:00 UTC
From: progrock@digital.net
Message-ID: <3us5la$1bu@ddi2.digital.net>
Source record: 24498

Hello all!!

My name is Mike Whaley KD4UGI, and I would like to ask for help from the readers of this group with a worthy cause. I am a Technical Specialist with the Astronauts Memorial Foundation at the Center for Space Education at the visitor's center at the Kennedy Space Center. AMF is a non-profit independent organization that was originally set up a month after the Challenger tragedy to honor all U.S. Astronauts who have given their lives in the line of duty. As a living memorial to them, AMF operates the Center for Space Education. We basically take the latest in Instructional Technology (IT)... computers, software, etc... and teach educators how to incorporate it into today's classrooms. It is quite a comprehensive program, after an educator goes through a workshop they have been instructed in everything from basic computer troubleshooting and repair (hardware and software), the use of software of all descriptions, and how to use this technology effectively so that really improves the education of their students rather than sitting unexploited as often happens at many schools who don't know how to use it. We typically teach three teachers from every school in a district, right now we focus mostly on Florida but work in conjunction with NASA education programs and others so that we see quite a cross-section of teachers from all grade levels, subjects, and locations. I work on the Instructional Technology Evaluation Center, which is a large computer lab with 10 Macintosh and 7 PC platforms that allows us to both do training and to allow educators to "test-drive" all sorts of educationally-related software and determine its suitability to their needs before spending shrinking budget money on it. This is a free service open to teachers, and is supported by the donations of many software and hardware vendors. If you are a teacher and want more info about any of this, please call AMF at the number below and we can tell you more details!

I think it is important to point out that even as comprehensive as our programs are, there is NO COST to the participants, other than the costs they incur in travel, lodging, and for substitutes at their home schools. AMF is supported by the funds from the Florida Challenger license plate program and from private donations. We are not a government agency, we are entirely independent although we have working partnerships with many organizations and businesses.

I am posting this to r.r.a.space because I now have a unique opportunity to start a Shuttle Amateur Radio Experiment (SAREX) station there. I am sure that most of you are familiar with SAREX contacts where students get to ask questions of Shuttle crew members, but in my view it would be even more useful and lasting to get the teachers fired up about amateur radio, space, and technology because they can then pass it along to hundreds or

thousands of students. I have approval from the powers that be to do this project, however, with all the other educational projects that are ongoing I need to get as many donations of equipment and help as I can before we think about spending a lot of money. (Ie, only buy things that we can't get donated or permanently loaned.) As the only ham currently working at AMF, I am far more familiar with this than my co-workers, although myu boss does know about it and has seen a videotape of a SAREX school contact, and is supportive of this project. Basically, I would like to get a good start (by getting not only equipment but volunteers to assist with this project) before I push for significant sums of money. I believe that once we have the capability of making contacts, not just SAREX but Mir, satellite, and terrestrial, then it will become obvious how valuable a tool this can be to get teachers interested.

For anyone out there who may be considering donating, remember that this will be in a very high-visibility location... the KSC visitor's center is the third most-visited attraction in the state of Florida. So of course, the publicity value for companies is significant. (We will be sure to publically acknowledge any assistance given us.) This is in the formaticve stages right now, I have some ideas about specific equipment I would like to use but I will consider anything. At minimum, right now we need a 2-meter radio, a satellite antenna and the associated rotators and mast, coaxial cable, and an amplifier to put out 150 watts or so if the radio won't do that. Of course, I envision having a much more complete/capable station than that, eventually we would like to have a special event station to commemorate the return-to-flight after Challenger so a full-blown station is something to look forward to. But for now, my main goal is showing that this can work, and that should open up doors and allow it to expand.

Thank you, and please feel free to either e-mail, call, snail-mail, or visit!

Aloha !

A while back I saw a post that had a great list of frquencies of all the birds, and their becons and modes etc. The list also had the formula's for determining the uplink/downlink values. i.e. MODE B 581.398 - Uplink = Downlink etc.

Has anyone seen this list, and if so, can they "Re Post" ?

Many thanks !

Steve W. Teegarden

The power supply is another 16,000 :-)

My 100 mW Gunn Oscillator cost $100 new. That's $1 a milliwatt. Sheesh, now I know why HF is so fun...

Cool! This saves me having to ask the question <G> I'm thinking of writing a space-exploration game, and it would be REALLY cool to have all the real stars acurately represented (say, within 100 light years of earth at the very least.)

can anyone give me a rough guestimate of the number of stars with 100-1000 light years of earth?

Bruce M. Marshall (bmm1@freenet3.scri.fsu.edu) wrote:
: Kory:

: Your questions are typical of those that everyone asks as they think
: through setting up a LEO (low earth orbit) ground station. You are
: asking the right questions, so you are on the right track. I have not
: tried an eggbeater however I would like to. I would like to find the
: perfect LEO, non-az-el-rotor ground station combination. Most "omni"
: antennas are not omni in 3 dimensions but in 2. This is fine for
: signals coming from the direction of the horison. Of course satellites
: don't always come from the direction of the horizon. However their
: signal is most attenuated when they are near the horizon. Therefore an
: antenna with some more gain on the horizon is benificial. An "omni"
: antenna with 8 to 11 db gain will do very well for passes of low
: elevation and the low elevation portions of higher passes but will
: loose the signal above 40 to 60 degrees even though the satellite has
: the strongest signal at this point in the pass. I suppose the egbeater
: will perform better at these higher elevations than a gain omni which
: will have a gain of less than 1 at high elevations. The eggbeater will
: perform poorly at low angles. When setting up a ground station an
: important question is "how much of the horizon can I see?". Here in
: eastern Tennessee the mountains and high trees can result in much or
: little very little view of the horizon. In this case an antenna such
: as a quadrifilar helix with a high gain at higher elevations would bea
: good choice. In Kansas, or on a mountain top the choice would be
: different.

I just had a thought - how about using two antennas. One higher gain
for the lower elevations, the second with 0 to some gain at the
higher elevations.

The antennas could be either be combined (phased appropriately to give
the pattern and coverate you are looking for), or using some
simple logic and a pin diode swith at the receiver, switch between
the antenna with the "best" signal.

Problem of course is that the antennas need to be circularly
polarized ... and combining two circularly polarized antennas
would probably look pretty weird;-) (I'm thinking of a
quadrafilar stuck on top of two 3 element circular polarized
yagis, that are mounted at 90 degrees:-)

im
: As for preamps, a mast mounted preamp is a must for 70cm. At 70cm the
: attenuation even in very good coax is unacceptable if you have more

: than a short run of coax. Get a copy of the satellite experimenters
: handbook and work some of the antenna/preamp/coax equasions. They are
: tedious but very educational.

: I have more ideas on the perfect LEO groundstation however I have been
: summoned for dinner (and it looks and smells exceptionel) so will
: write more if coaxed.

the "General Catalogue of Trigonometric Parallaxes (1991)" that came on
my ADC CDROM contains 253 stars with a parallax in excess of 0.1 arc seconds.
that is, less than 10 parsecs in distance. if this stellar density is
scaled out to 300 parsecs (about 1000 lightyears), you get 6.8 million
stars. the real number could be quite a bit higher.

1599. Meteors by radio: the FAQs

Newsgroup: rec.radio.amateur.space
Date: 1995-07-25 00:00:00 UTC
From: steyaert@vvs.innet.be
Message-ID: <steyaert.2.0015170D@vvs.innet.be>
Source record: 24507

Hopefully still in time for those who want to observe the Perseids by radio,
this year when the Moon hampers the visual observations...

METEOR SCATTER - the FAQs Rev. 1, Jul 25, 1995.

0. About these FAQs

These FAQs are the result of your various questions and remarks to the
monthly RMOB (Radio Meteor Observation Bulletin).
Constantly amateur astronomers, radio amateurs and schools looking for
new projects, get involved in observing meteors by radio methods, and
need the same basic information.

0.1. Revision / posting frequency

I am sure there will be many questions and remarks to this first issue.
The section with references has to be expanded considerably. And undoubtly,
we will hear from existing radio setups for the first time. Rev. 2 can be
expected at the end of August.

0.2. Distribution

These FAQs are posted on:
sci.astro.amateur
rec.radio.amateur.space
Compuserve's Astronomy Forum, Section 11, Radio Astronomy.

Please let me know if you feel that other newsgroup are interesting too or
more appropriate.

0.3. Acknowledgement

Many thanks to Tom Ashcraft (72632.1427@compuserve.com) and other participants
to Compuserve's Astronomy Forum.

1. What is meteor scatter (MS) ?

Meteor scatter is a form of electromagnetic wave propagation. The ionized
trail of meteors (typically appearing between 100 km and 80 km high) acts
tempora- rily as a reflector for radio waves.
A meteor does NOT generate detectable radio emission itself!

In the case of forward scatter, the transmitter and receiver are at
different locations. Backscatter can be seen as a special case, whereby
the sender and receiver coincide (typically the case of radar).

Meteor scatter can be used day and night, allowing daylight meteors
streams to be studied.
Meteor scatter can also be used for secure communication.

Historically, meteor streams were conclusively detected by means of radar at the end of World War II.

2. How to observe MS ?

Tune to an "empty" frequency in the VHF band, and wait until a suitable oriented meteor trail reflects a distant broadcasting station. You hear a more or less short (a fraction of a second to tens of seconds) fragment of the remote broadcast. Occasionally, more than one station (together or one after the other) can be heard. Routinely, stations of 300 km to 1000 km away can be observed. The problem however in densely populated areas can be to find a non-locally used frequency.

2.1. Which frequencies to use ?

The lower the frequency, the better... but at too low frequencies, the radio- waves bend and follow the curvature of the Earth.
A lower practical limit is 40 MHz. More commonly, the VHF is suitable.
VHF Band I ranges from 41 to 68 MHz, and is used for TV.
The FM band (88 MHz - 108 MHz) is also used frequently. Try as low as possible in the band, and avoid free radio's in the upper band (104-108 MHz).
Not to forget are beacons at e.g. 75 MHz.
Radio hams listen also to MS in the 2 m (144 MHz) band. The reflections are shorter and weaker than at the lower frequencies.
There is little use in trying MS at still higher frequencies.

2.2. Which equipment to use ?

A regular FM receiver is sufficient. An all-band receiver is of course better in terms of sensitivity and features such as bandwidth selection.
Connect a horizontally polarized Yagi antenna with 4 to 6 elements (not too directive) to your receiver. The antenna can be pointed horizontally, or at a certain angle (the latter avoids direct reception from nearby stations). Keep the antenna feed cable short to minimize losses, or add an antenna amplifier.
With a good setup, it should be easy to obtain 10 to 20 meteor reflections per hour when no stream is active (the sporadic background). During streams, this number can get as high as several hundreds.
Due to the daily variation in meteor activity, more reflections are received during the morning hours (5h to 6h local time) than in the evening (18h).
This can serve as a proof that you are actually observing meteors!

2.3. Always possible to observe ?

Unfortunately, other forms of propagation interfere with MS.
The worst one is sporadic-E or Es, consisting of conduction clouds in the high atmosphere that make permanent reception of remote stations possible during minutes to tens of minutes. The sporadic-E season is from May to July in large parts of the northern hemisphere. In some regions however, sporadic-E is unknown!

There are also tropospheric influences. A temperature inversion can also cause reception over wider ranges than normal.

Thunderstorms cause very sharp peaks. On FM, most of these (amplitude modulated) spikes are suppressed. However, DO NOT connect your antenna to your receiver during thunderstorms or when you are absent for longer time. Lightning strikes have ruined several radio shacks.

2.4. One step further: recording meteor reflections

Meteor reflections can easily be recognized by listening. But a better measure of the shape of the reflection can be obtained in accessing the signal strength and recording it, either on a pen recorder, either feeding it into a computer via an analog/digital (A/D) convertor. Special care has to be taken to shield well the computer, power supplies etc., or the computer signal will be more or less noticed in the receiver.

Meteor reflections can broadly be divided in two classes - underdense and overdense - with different reflection profiles. These profiles can be related to the physical characteristics of the meteors.

3. Who else is observing ?

During recent years, amateurs in following countries have been recording meteor reflections: Austria, Belgium, Denmark, Germany, Finland, the Netherlands, the UK, the USA.

Some of them observe only during the periods of the great streams, others run continuous automated stations.

Only a few radars are still used for monitoring streams. One is run by O. Belkovitch (oleg@astro.kazan.su), at Kazan University.

4. How to relate radio- to visual observations ?

Hearing and seeing a meteor is a unique experience. There is a fairly simple relation between the visual magnitude of a meteor and the duration of the reflection. At 70 MHz, a zero magnitude meteor gives typically rise to a 1 second reflection.

5. How to correct MS counts to standard conditions ?

The number of meteor reflections that will be observed from a certain stream is not a simple function of radiant height, as is the case with visual counts (cfr. the zenithal hourly rate).
Conversely, deriving the true number of meteors from the observed number of meteors is not a trivial matter, certainly not when more than one transmitter is involved. Certainly, a stream does not necessarily peak when the observed number of meteors is highest!

The various parameters, such as antenna characteristics, position of transmitter and receiver, radiant position and other stream characteristics, power of the transmitter etc. can be fed into a simulation program, such as FORWARD (by the undersigned). Although the general activity pattern can be reconstructed, one has to be careful.

For visual meteors, the observed number is highest when the radiant is in the zenith (all other remaining the same). This is not so for the number

of meteor reflections: the maximum number is observed for a radiant elevation of 45 to 50 degr. When the radiant is too high (say more than 80 degr), very few reflections are received!

6. Where to find meteor stream data ?

The International Meteor Organization (IMO), specializing in visual meteor observations, issues a yearly meteor stream calendar, which can be found on several places on the net. Contact otherwise Juergen Rendtel (jrendtel@aip.de) or Peter Brown (peter@canlon.physics.uwo.ca).

Gary Kronk's home page [http://wums.wustl.edu/~kronk/index.html] gives also a good overview of the various streams.

7. Where to find observational data and reduction software ?

Ilkka Yrjola, OH51Y (ILKKA.YRJOLA@915000.KY.KYMMENE.MEMONET.mailnet.fi) makes his data available on ftp server FTP.FUNET.FI in directory pub/ham/vhf-work/mssoft42.zip. The software for viewing is available too, as well as stream data.

The author edits the monthly RMOB, which gives summaries of recent observations from all over the world. Included are the setup characte-ristics. Just contact me for putting you on the distribution list.

8. References

8.1. Books

THE reference is still "Meteor Science and Engineering" by D.W.R. McKinley, McGrawHill 1961. A fantastic book, giving the theory and practical results of the heydays of the radio meteor science.

A recent, less astronomical and more communication oriented work is: Meteor Burst Communications (Theory and Practice) Ed. Donald L. Schilling, Wiley Series in Communications, 1993, ISBN 0-471-52212-0.

8.2. Periodicals

The regular astronomy magazines, such as Sky & Telescope, Astronomy, or Astronomy Now! run occasionally contributions about forward scatter experiments (due to lack of time: complete list in Rev. 2 of these FAQs).

WGN, the Journal of IMO, contain sometimes contributions and letters about radio observations of meteors.

ATTENTION ATTENTION ATTENTION ATTENTION

CableVision Of Hauppauge Subscribers

On Sept 1,1995 Cablevision will DROP Broadcasting the NASA SELECT TV Service
that is on channel 1/52 from 10am-4pm 12am-6am.....

I think the only way to save NASA SELECT is by calling Cablevision
and telling them to keep NASA SELECT.. Even if you don't have
CABLE TV or CableVision of Hauppauge you should call. I heard
that they are dropping NASA SELECT because they never get calls
praising there REBroadcasting of NASA SELECT..

So come on and give them a call, or if you want to watch NASA SELECT
you'll have to get a Satellite TVRO 10ft Dish...

*** The 18" DSS (DBS) System does NOT have NASA SELECT ***

CableVision can be reached at (516) 348 - 6800 Main Switchboard
348 - 6700 Sales
582 - 8324 Marketing
348 - 6872 FAX

CALL NOW .... We can't lose NASA SELECT

Thanks for the HELP,

Keith

David,

The most recent Shuttle mission was STS-70, primary mission was the
deployment of TDRS-G. <-- Very usefull stuff I think.

The next Shuttle mission will be STS-69, mission is the second flight
of the WSF, deploy & retrieve the Spartan 201 astronomy sat., and to
test space station assy. techniques and improved space suits. <-- Useful?
I don't know but maybe.

After STS-69 will be STS-73, primary mission is Micrograv. lab. 2 <-- Useful?
No, this is just a mission so it looks like their doing something.

71(MIR-Docking) had SAREX, 70 had it, but I don't know about 69 or 73.

We should know by the end of next week if any future flights will be
delayed due to the charred O-ring found at the base of one of the
SRBs from STS-70. It was found after examination at M. Thiokol
and NASA is determining what if anything should be done about it.

No, STS-73 is not up now. What do you consider useful? Only SAREX,
sat. repairs, dockings, discovering if mouse terds in microgravity
are round or cylindrical?

Yes I was being sarcastic all the way through this post.

It has been my experience that cable companies DO NOT listen to
call-ins. They can't quantify it to their management. But letters
in hand they can! Don't call, Write to your cable company or you
may be fighting a losing battle from the start...

1615. 7/29 Atlanta Balloon with ATV/Packet/GPS/2 meters/10 Meters/70cm

Newsgroup: rec.radio.amateur.space
Date: 1995-07-28 00:00:00 UTC
From: rwf@mindspring.com
Message-ID: <rwf.242.007EC417@mindspring.com>
Source record: 24323

ATLANTA BALLOONATICS
Atlanta Balloon Update on 28 July 1995:

All equipment for all packages on hand.
Payloads modules tested. Final integration underway.

DATE/TIME : Saturday July 29th or Sunday July 30th
: Release 0930EDT (1330Z) 0930EDT (1330Z)
: Weather conditions will control exact time of release

*** Launch site now appears to be favoring Dallas GA.

RELEASE SITE:

** : Dallas, GA 30 miles NW of Atlanta, GA
: Coordinates ??

: Payload weight : 5-pounds
: Balloon : TOTEX TA-1200
: Helium : 180 cu ft
: Ascent rate : 750 fpm
: Max altitude : 110,000ft
: Max radio range: 470sm

FREQUENCIES AND MODES

: Packet Radio Downlink 441.0 MHz 2W
: Retransmitted from ground into APRS net on
145.79 MHz and on 14.105 MHz LSB
: Standard AX.25 1200BPS AFSK FM
: Sending APRS-compatible NMEA-183 GPS navigation data
: No Open digipeating. No receiver. Don't try.

: Altitude, Inside & Outside Temperature telemetry on:
146.575 MHz , 28.322 MHz , & 438.5 MHz (wide band TV
audio)

**** : Charts for decoding of C.W. telemetry may be
found on WorldWide Web at address
http://www.mindspring.com/~rwf

*** : ATV camera (B&W) with 1 watt AM transmitter on 434.0 MHz

: All antennas vertically polarized

EXPERIMENTS : More experiments in BASIC stamp control of balloon payloads.
Stamp controlled servo/mirror for multiple
camera views, 12 bit altimetry and 2,

8 bit temp probes.

Possible HF net on 3.780MHz before and during mission. Still do not have a Net Control. Anyone wanna come do it?

For more details about this project, see the WWW address:

> is sts-73 actully up now?

No, what you saw was a sim. They are testing Fast scan on non-ham freq.
(something called ground to air tv). Something we have done already.
(Except theirs is compressed).

SAREX is not scheduled until STS-74.

1620. Two-Line Orbital Element Sets (TLE647)

Newsgroup: rec.radio.amateur.space
Date: 1995-07-29 00:00:00 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.807044030@dolphin>
Source record: 24328

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (334) 409-9280, and are updated daily (when possible). Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at speeds up to 28,800 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily) and some documentation and software are available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space.news and rec.radio.amateur.space. This week's elements are provided below.

Keplerian bulletins are transmitted twice weekly from W1AW.
The next scheduled transmission of these data will be Tuesday,
August 1, 1995, at 2230z on Baudot and AMTOR.

1622. EOSS-24: July 30 CENTRAL COLORADO BALLOON LAUNCH

Newsgroup: rec.radio.amateur.space
Date: 1995-07-29 00:00:00 UTC
From: au156@yfn.ysu.edu
Message-ID: <3ve4eh$m0e@news.ysu.edu>
Source record: 24330

EOSS-24: CENTRAL COLORADO REPEATER/ATV BALLOON LAUNCH

Region: Central Colorado

Date/Time: July 30 / 9:00 AM MDT, 15:00 UTC

Location: Monument, Colorado (20 miles north of
Colorado Springs)
Site Coordinates: 39.09 North Lat.
104.87 West Long.
ATV: 426.25 MHz AM (1 watt output) NTSC color
video
VHF/UHF Repeater: 446.000 MHz FM Input
147.555 MHz FM Output
(note change as of 7/16/95)
Beacons: a) 147.555 MHz carrier from repeater always
on; (periodic Morse ID audio on FM)
b) 144.34 MHz Morse ID audio on FM
(periodic; frequency shared with packet
telemetry)
Telemetry: 144.340 MHz FM (1 Watt output) - AX.25, 1200
baud mostly plain english text; includes APRS
position data string.
Foxhunters: Pikes Peak FM Association, 448.450 MHz
(tentative)

From: tkelso@afit.af.mil (TS Kelso)
Newsgroups: rec.radio.amateur.space
Subject: Two-Line Orbital Element Sets (TLE647)
Date: 29 Jul 95 18:53:50 GMT
Organization: Air Force Institute of Technology
Message-ID: <tkelso.807044030@dolphin>

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (334) 409-9280, and are updated daily (when possible). Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at speeds up to 28,800 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily) and some documentation and software are available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space.news and rec.radio.amateur.space. This week's elements are provided below.

EOSS-24: CENTRAL COLORADO REPEATER/ATV BALLOON LAUNCH

Region: Central Colorado

Date/Time: July 30 / 9:00 AM MDT, 15:00 UTC

Location: Monument, Colorado (20 miles north of
Colorado Springs)
Site Coordinates: 39.09 North Lat.
104.87 West Long.
ATV: 426.25 MHz AM (1 watt output) NTSC color
video
VHF/UHF Repeater: 446.000 MHz FM Input
147.555 MHz FM Output
(note change as of 7/16/95)
Beacons: a) 147.555 MHz carrier from repeater always
on; (periodic Morse ID audio on FM)
b) 144.34 MHz Morse ID audio on FM
(periodic; frequency shared with packet
telemetry)
Telemetry: 144.340 MHz FM (1 Watt output) - AX.25, 1200
baud mostly plain english text; includes APRS
position data string.
Foxhunters: Pikes Peak FM Association, 448.450 MHz
(tentative)

1626. Re: FOR SALE OR TRADE: MICROWAVE AMPS & ACCESSORIES

Newsgroup: rec.radio.amateur.space
Date: 1995-07-30 00:00:00 UTC
From: rwham@aol.com
Message-ID: <3vgfko$5ud@newsbf02.news.aol.com>
Source record: 24334
Cross-posted to: rec.radio.swap,rec.radio.amateur.space

Prices are way out of line with amateur practices, but some hams are also Engineers. They (or more likely their business) may have use for the equipment, and a reasonable justification to purchase it. Meanwhile back at the shack, If you have any 20 watt Xband TWTAs, or 75 watt Sband amps (TWTA, Tube, or solid state) for ham prices I would sure like to know about them.

1627. LEO Operational Schedules - Sources?

Newsgroup: rec.radio.amateur.space
Date: 1995-07-30 00:00:00 UTC
From: jwhac4ca@mindspring.com
Message-ID: <jwhac4ca.9.0043CA95@mindspring.com>
Source record: 24335

Does anybody have a source for information about which polar weather satellites are operational? E.g. NOAA-9 appears to be off right now. I saw no notice anywhere that NOAA was turning it off. I would like to find some place on the net that publishes this kind of information for any and all polar weather satellites. Thanks in advance for the help.

1628. Re: Best frequencies for meteor scatter

Newsgroup: rec.radio.amateur.space
Date: 1995-07-30 00:00:00 UTC
From: jschanker@aol.com
Message-ID: <3vh3rr$c6e@newsbf02.news.aol.com>
Source record: 24336

Jos. wrote:

:Can anyone tell me the best frequencies for meteor scatter
communications.
:The frequencies listed do no necessarily have to be within the amateur
bands.

Generally speaking, the frequencies up to about 70 MHz are best. This
includes
frequencies usually considered HF such as 28 MHz. But there are a *lot* of
variables to consider - it also depends on what you are trying to
accomplish.

* STRIKE AVERTED *
==================
Richard, G3RWL, reports that the underground strike that threatened
transportation to and from the annual Satellite Colloquium at the
University of Surrey has been cancelled by legal action. All services
are expected to operate normally throughout the duration of the Colloquium.

* STS-69 MISSION PROFILE *
==========================
This file summarizes the nominal mission profile for STS-69. This data
is very useful immediately after launch, before the first Keplerian
Two-Line Elements (TLEs) are released. This data is also useful when
real-time data (vectors and/or TLEs) are not available following an orbit
adjust. Each vector is listed with its associated event in the table.
Those events involving an orbit adjust are preceded by an asterisk (*).

The table lists pertinent information for the nominal Earth-Fixed
Greenwich (EFG) vector files included for STS-69. The applicable time
for each vector begins with the Mission Elapsed Time (MET) of the vector
and ends with the Mission Elapsed Time (MET) of the next vector. These
vector files may be read directly by VEC2TLE Version 9435 (see V2L9435.ZIP)
to compute the Keplerian Two-Line Elements (TLEs) for the Shuttle.

NOTE: The current scheduled launch date and time of STS-69 is:
05-AUG-95 / 14:45 UTC. This file will be updated with any significant
variations to the orbit profile.

By setting the scheduled launch time in VEC2TLE, you can compute the TLEs
corresponding to each vector. If the launch date and/or time changes, the
only change that needs to be made is the Launch date and time in VEC2TLE.
The vectors are Earth-Fixed (EFGs), so they are time-independent. Thus,
once the launch date/time is changed, these same vector files will compute

updated TLEs for the mission.

* NORTH TEXAS BALLOON PROJECT NEWS *
==========
The North Texas balloon project will launch its seventh high altitude
balloon experiment carrying amateur radio payloads on the 19th of
August, 1995. The payload carries a variety of radios and instruments
that can be easily used by any Amateur with a Technician's license or
above.

The launch will be from Clifton, Texas (located 30 miles west of Hillsboro)
at approximately 9:30 AM. In the event of inclement whether, the launch
will be delayed to the next day, and then to the next Saturday (the 26th).
There will be a pre-launch net at 8:30 PM on the Ft. Worth 146.76 repeater
the evening before the launch. The morning of launch there will be an HF
net on 7.155 MHz +/- QRM. The Net control station will probably be W5IU.

Approximately two hours after launch, the balloon is expected to reach
an altitude of 95,000 feet before burst. At this altitude the area of
visibility will be about 370 miles in any direction for a total 740 mile
communications range. In past missions, there have been QSO's between
Corpus Christi, TX and Salina, Kansas.

The following is a list of the available experiments onboard:

Two Crossband FM Voice Repeaters:
There will be two crossband FM repeaters open to all.
Uplink #1 147.450 MHz Downlink #1 445.850 MHz

Uplink #2 147.570 MHz Downlink #2 445.970 MHz

Packet Telemetry on 144.290 MHz:
This GPS and telemetry information will be the data downlink
(downlink ONLY) of the mission. The packet format is the common
1200 baud AFSK found in all TNCs. The data will be presented in
an easy to read format with no conversions required and is NOT in
APRS format. Packet digipeating and packet connects to the package
will NOT be possible.

GPS:
Precise longitude, latitude and altitude data will be provided by
a donated Rockwell NavCore V GPS receiver. The following data
will be measured and can be seen on the 144.290 MHz downlink.
Six of the eight channels are used to measure the following:

* Inside Temperature * Outside Temperature
* Barometric Altitude * Main Battery Voltage
* ATV Battery Voltage * Summed Battery Voltage

Amateur Television (ATV)
There will be a live, full motion, Amateur Television camera
and 10 Watt transmitter onboard. The downlink frequency will be
439.250 MHz VERTICALLY Polarized. This frequency was chosen to
exactly correspond to Cable channel # 60. With a 440 MHz beam and
reasonable Low Noise Amplifier, a cable ready TV tuned to Cable
channel 60 should be able to receive an acceptable signal.
The camera will be remotely pointed via ground command to any of
256 possible positions.

Other Innovations On NTBP #7
Active package stabilization:
.....Remotely controlled air foils to cancel package spin.
Power distribution:
.....Non essential equipment turned off after touchdown and batteries
summed to provide power to essential DF'ing beacons.
Audio Distribution
.....Ground commands allow audio from crossband repeaters, packet
downlink, or command uplink to be piped through ATV audio.
Improved Parachute/Tow line
.....New spreader ring design, swivels and woven tow line should help
ensure that parachute does not tangle.

QSLs can be had through KG5OA via the Callbook address.

* LO-19 NEWS *
==========
Rudy Benner, VE3BDR, in Timmins, Ontario reports that the fileserver on
LUSAT-OSCAR-19 appears to be back in service.

* AO-27 NEWS *
==============
The AO-27 Amateur communications transponder schedule as of 25-Jul-95 is
as follows:

AO-27 Enters Sunlight, Transmitter is OFF
18 Minutes after Entering Sunlight, Transmitter is ON at 600 mW
20 Minutes Later, Transmitter Turns OFF

AO-27 is OFF for the entire Eclipse

For thoses who know about the TEPR states:

TEPR 1 Duration 15 Minutes, OFF
TEPR 2 Duration 15 Minutes, OFF
TEPR 3 Duration 3 Minutes, OFF
TEPR 4 Duration 18 Minutes, OFF
TEPR 5 Duration 20 Minutes, ON, Power 2 (Aprox 600 mW)
TEPR 6 Duration 28 Minutes, OFF

This gives coverage on the daylight passes from when the Satellite
subsat-point is between about North 74 degrees and North 5 Degrees.

Comments about changing the schedule can be sent to N4USI@amsat.org

[Info via Michael Wyrick, N4USI - AO-27 control operator]

* AO-13 OPERATING SCHEDULE *
============================
The following is the current AO-13 transponder schedule effective 31-Jul-95
through 30-Oct-95:

Mode-B : MA 0 to MA 140 |
Mode-BS : MA 140 to MA 240 |
Mode-B : MA 240 to MA 256 | Alon/Alat 225/0
Omnis : MA 250 to MA 140 | Move to attitude 180/0, Oct 30

1631. Free Ham Radio Test Simulators - Macintosh

Newsgroup: rec.radio.amateur.space
Date: 1995-08-01 00:00:00 UTC
From: john@wd1v.mv.com
Message-ID: <john-0108950605310001@wd1v.mv.com>
Source record: 24339

The new Macintosh Ham Test Simulators are HERE!

Novice Ham Test 5.0 SA.sea
Technician Ham Test 5.0 SA.sea
General Ham Test 5.0 SA.sea
Advanced Ham Test 5.0 SA.sea
Extra Ham Test 5.0 SA.sea

The latest versions feature:

HyperCard 2.3 as a stand-alone application (SA) eliminating
the need to have HyperCard. All you need is a Mac with 4
Meg of memory and version System 7 or greater.

Each version 5 Ham Test Simulator has the latest questions
as prepared by the Question Pool Committee.

Each Ham Test Simulator is FREE OF CHARGE and work the
same way as the originals written by Diana, KC1SP.

You may obtain a Ham Test Simulator by mailing me a *FORMATTED
disk (1 per test) and include a Self Addressed and Stamped disk
mailer for the return.

Each Ham Test Simulator is also bundled with a shareware CW
program called MacMorse 1.4 written by Doug, WB0EON.

Also included are a collection of text files that relate an
interesting variety of ideas about the best way to study CW and
prepare for tests.

If you load these onto file servers where others can gain access
via Internet, please let me know so we can point others in that
direction.

Your comments and suggestions for future versions are always
welcome. Stay in touch and good luck with your next test!

73,

>
>Does anybody have a source for information about which polar weather
>satellites are operational?
I know for certain that NOAA 12 and NOAA 14 are operational. NOAA 9
was operational last week but not up for the 9507.31 03:00Z pass. I
could not even get the tracking beacon.
The NOAA LEO WX SAT operation number is 301 457 5120.
NOAA has a web server with some st info. It is under construction
and I don not have the address handy, just do a web search. There is a
weather sat news group, you have to subsrcibe and I guess they email you
interesting things. I have tried to subscribe several times, but I think
there is something "strange" with our on campus system. I have not had
any sucess doing anytype of subscribe, to any service.
If you need the ng address just check through back posting in this ng or
drop me an Email and I will dig it out for you you.

Depends what you want to do. The PK-900 does NOT have a 9600 bps FSK modem
where most of the satellite digital stuff is. The DSP-2232 DOES have the
required modem for 9600 as well as a lot of other stuff.

What modes do you want to use?

>any ideas

I have made ONE SSB contact on RS-15 with my Icom 251A putting out
10 watts into a KLM 2M14C circular satellite antenna on AZ-EL mount.
Pointed at the satellite, this should be an effective power of 100 watts
or so. It was rough and I can't do it with the satellite near the
horizon although CW will probably work. I recommend you try a yagi
which will help a lot when the sat is near the horizon.
A good receiving antenna is also needed as I have heard several guys
on there that are getting in good but can't seem to hear themselves
or others. Again, I recommend a yagi, possibly with a pre-amp at the
antenna.
This satellite is over twice as high as RS-10 and RS-12 while also
having a weaker transponder and serious spin modulation. Try CW ;-}

1640. Re: RS-15 Power how much !!!!

Newsgroup: rec.radio.amateur.space
Date: 1995-08-03 00:00:00 UTC
From: timtj@aol.com
Message-ID: <3vpjq4$rhn@newsbf02.news.aol.com>
Source record: 24348

My suggestion is to try a different antenna. Although I have not tried to get into the RS-15 bird, I did have success with several of the earlier RS birds while running about 35 to 40 watts output into a crossed dipole antenna up about 20 feet. It didn't work well when the bird was on the horizon, but on overhead passes I had no trouble. I was using CW. You might need a bit more power if you're using SSB.

1641. ESTERLINE ANGUS???

>where most of the satellite digital stuff is. The DSP-2232 DOES have the
>required modem for 9600 as well as a lot of other stuff.

well, the 900 has a op. 9600bps add on, but i does state <in the
catalog...good for satellites>

>What modes do you want to use?

well, whatever is used in sat. work, fax, sstv, rtty, and cw

1644. NORAD Two-Line Orbital Element Set Format

Newsgroup: rec.radio.amateur.space
Date: 1995-08-04 00:00:00 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.807503353@dolphin>
Source record: 24352

As a service to the satellite user community, the following description of the NORAD two-line orbital element set format is uploaded to sci.space.news and rec.radio.amateur.space on a monthly basis. The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (334) 409-9280, and are updated daily (when possible). Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at speeds up to 28,800 bps using 8 data bits, 1 stop bit, no parity. In addition, element sets (updated daily) and some documentation and software are also available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

==========

Data for each satellite consists of three lines in the following format:

```
AAAAAAAAAAAAAAAAAAAAA
1 NNNNNU NNNNNAAA NNNNN.NNNNNNNN +.NNNNNNNN +NNNNN-N +NNNNN-N N NNNNN
2 NNNNN NNN.NNNN NNN.NNNN NNNNNNN NNN.NNNN NNN.NNNN NN.NNNNNNNNNNNNN
```

Line 0 is a twenty-two-character name (this change is being made to be consistent with the name length in the NORAD SATCAT).

Lines 1 and 2 are the standard Two-Line Orbital Element Set Format identical to that used by NORAD and NASA. The format description is:

```
Line 1
Column Description
01-01 Line Number of Element Data
03-07 Satellite Number
10-11 International Designator (Last two digits of launch year)
12-14 International Designator (Launch number of the year)
15-17 International Designator (Piece of launch)
19-20 Epoch Year (Last two digits of year)
21-32 Epoch (Julian Day and fractional portion of the day)
34-43 First Time Derivative of the Mean Motion
or Ballistic Coefficient (Depending on ephemeris type)
45-52 Second Time Derivative of Mean Motion (decimal point assumed;
blank if N/A)
54-61 BSTAR drag term if GP4 general perturbation theory was used.
Otherwise, radiation pressure coefficient. (Decimal point assumed)
63-63 Ephemeris type
65-68 Element number
69-69 Check Sum (Modulo 10)
(Letters, blanks, periods, plus signs = 0; minus signs = 1)
```

Line 2
Column Description
01-01 Line Number of Element Data
03-07 Satellite Number
09-16 Inclination [Degrees]
18-25 Right Ascension of the Ascending Node [Degrees]
27-33 Eccentricity (decimal point assumed)
35-42 Argument of Perigee [Degrees]
44-51 Mean Anomaly [Degrees]
53-63 Mean Motion [Revs per day]
64-68 Revolution number at epoch [Revs]
69-69 Check Sum (Modulo 10)

All other columns are blank or fixed.

Example:

NOAA 6
1 11416U 86 50.28438588 0.00000140 67960-4 0 5293
2 11416 98.5105 69.3305 0012788 63.2828 296.9658 14.24899292346978

You won't find much of any of those on satellites. What you will find is primarily two types of packet. They are 1200 bps and 9600 bps. The 1200 bps uses phase shift keying, while 9600 bps uses a form of frequency shift keying.

Both require specific modems and connections to your transceiver. If you were to set up a PK-900 with a G3RUH modem afor 9600 bps and a psk modem, you would be up there in price with the DSP-2232. Also, the 9600 option for the PK-900 is not really a satellite modem, although it can be used as such with reduced performance.

I have a PK-900 which I use on my boat for HF work, but my satellite is done with a dsp. If you cannot afford the DSP-2232, you might want to check out the DSP-93 kit from Tapr. It is not a complete unit like the 2232, but is about half the $$$. This is definitely a kit, and is meant for experimenters.

ATLANTA BALLOONATICS

Balloon #4 Mission Update as of Aug 4, 1995 at 12:00Z

As you probably know, last Saturday's balloon experiment (carrying a GPS, packet radio, and ATV camera and transmitter) was postponed due to weather. It was rescheduled to Saturday August 5th.

Lots of bad weather is still passing through this area due to Hurricane Erin. Many damaging thunderstorms occurred throughout last night.

A preliminary go/no go decision will be made this afternoon, around lunch time. I'll try to get the word out here as quickly as possible.

Bill Brown, WB8ELK, is almost a "local" now, living in Huntsville AL and has told us he will be attending this launch.

If you do not have EMAIL access at home, you can get an update from our info line at (404) 936-3737. The info on there at the moment is very stale, and I probably will not update it until after 17:00Z. today.

The DSP-93 is a DSP processor developed by TAPR and AMSAT. It comes with
all the satellite and terrestrial modems (HF as well as VHF/UHF) as well
as other stuff (audio oscilloscope, audio spectrum analyzer, audio
function generator, (soon) W9GR-like audio procesing. Most modems require
an external TNC and connects via the modem disconnect header. See the TAPR
web page for a lot of additional info:

http://www.tapr.org/tapr/

Internal TNCs are under development by TAPR and others also.

30 To be launched on need in FY '96

Notes
-----
1. NASA Catalog Number is also known as NORAD or U.S. Space Command object
number.
2. No orbital plane position = satellite no longer operational.
3. Clock: Rb = Rubidium; Cs = Cesium.
4. Selective Availability (S/A) had been enabled on Block II satellites during
part of 1990; S/A off between about 10 August 1990 and 1 July 1991 due to
Gulf crisis; standard level re-implemented on 15 November 1991; occasionally
off for test and other purposes. Currently, PRN15 and PRN28 appear to have
little or no S/A imposed.
5. Anti-spoofing (A-S) was activated on 94-01-31 at 00:00 UT on all Block II
satellites (ref. NANU 050-94042); occasionally off for test and other
purposes. A-S was turned off on all satellites at 20:00 UT on 95-04-19 and
back on on 95-05-10 and was off again between 95-06-19 and 95-07-10. A-S
has been off on PRN28 since 95-02-21.
6. PRN number of SVN32 was changed from 32 to 01 on 93-01-28.
7. PRN05 and PRN06 are equipped with corner-cube reflectors for satellite laser
ranging (SLR). SLR tracking of the satellites will permit onboard clock
errors and satellite ephemeris errors in GPS tracking to be differentiated.
8. The decommissioning date for PRN06/SVN03 is the date of termination of
operations of this satellite (ref. USNO) and is about 3 weeks later than the
date GPSIC gives for "deactivation".

This lab used to have a phone BBS. Is there access now on the WWW? They used to have some interesting info on solar flares and geomagnetic phenomena. Might be useful to predict dx.

A place to start is:

http://www.ncdc.noaa.gov/noaa/noaa.html

NOAA seem to have a lot of sites.

Yes!! It looks like a GO

Atlanta Balloon Update as of 3 August 1995:

All equipment for all packages on hand.
Payloads modules tested. Final integration complete.
Launching from Crossroads, GA. (NW of Dallas)

ATLANTA BALLOONATICS

Balloon #4 Mission Status

DATE/TIME
: Saturday August 5th or Sunday August 6th
: Release 0930EDT (1330Z) 0930EDT (1330Z)
: Weather conditions will control exact time of release

RELEASE SITE:

: Crossroads Elementary School, North of Dallas, GA
WB8ELK (Bill Brown) will be in attendance
: Coordinates 3400.48N 08446.12W

: Payload weight : 2.27kg (5-pounds)
: Balloon : TOTEX TA-1200
: Helium : 180 cu ft.
: Ascent rate : 750 fpm
: Max altitude : 110,000ft
: Max radio range: 640km (400sm)

FREQUENCIES
AND MODES

: Packet Radio Downlink 441.0 MHz 2W
: Retransmitted from ground into APRS net on
145.79 MHz and on 10.151 MHz LSB
: Standard AX.25 1200BPS AFSK FM
: Sending APRS-compatible NMEA-183 GPS navigation data
: No Open digipeating. No receiver. Don't try.

: Altitude & Temperature telemetry on:
146.575 MHz , 28.322 MHz , & 438.5 MHz (wide band TV
audio)

: B&W ATV camera with 1 watt AM transmitter on 434.0 MHz

: All antennas vertically polarized

EXPERIMENTS : More experiments in BASIC stamp control of balloon payloads.
Basic Stamp controlled servo/mirror for multiple camera views.
1 12 bit altimeter and 2 8 bit temperature sensors (inside and outside)
data will be sent as CW on the 10 and 2 meter frequencies

1661. Atlanta Balloon Flight Is Now History

Newsgroup: rec.radio.amateur.space
Date: 1995-08-06 00:00:00 UTC
From: rwf@mindspring.com
Message-ID: <rwf.260.0081F106@mindspring.com>
Source record: 24369

On August 5th, 1995, after a 1 hour weather hold,our balloon was launched
from Crossroads Elementary School near Dallas, GA. Bill Brown (WB8ELK) and
his girlfriend were there to lend a hand.

We even had an unplanned experiment: "Ants in Space" (with apologies to Gerry Creager's cows). Someone had set the
GPS payload down on an anthill, and we were going to have the first amateur
"Antronauts". :(

At liftoff, something caused the bottom payload (the GPS/TNC/TEKK Radio) to separate from the flight train.
This caused the balloon to ascend with only the ATV payload, Radar reflector,
parachute, and 10 and 2 meter beacons.

Those payloads worked flawlessly, and the fox hunters DF'ed the balloon with the aid of APRS and manual beam
headings, handi finders and Doppler units. A local fellow has a Company
(Directional Systems) that makes a NICE Doppler unit.

After a two hour flight, the package landed on a farm, in a 100 ft high Sweet Gum tree. The farmer tried to shoot down the
package for us with a rifle, but couldn't get all the strings. His son fi
nally felled the tree and we cut it up into logs and stacked it for him. The
payloads, including the video with servo controlled moving mirror all worked
while the balloon was in the tree and during the tree felling.

By the way, the first person to the balloon was WB8ELK. I know telemetry was received in Huntsville by KE4EER.
Any one else receive our beacons?

We'll post some images on the web site soon. And I will post the HST file of the DFing activities as well.

We have 1 balloon and 1 tank of helium left, so we'll fly it again soon (ALL of it, I hope)

For more details about this project, as well as telemetry decoding charts-

1663. Help w/ Noise levels

Newsgroup: rec.radio.amateur.space
Date: 1995-08-07 00:00:00 UTC
From: dstraumf@advtech.uswest.com
Message-ID: <dstraumf-070895142701@130.13.18.109>
Source record: 24371

I am in the process of setting up a new station (slowly)
and have been playing with a variety of antenna on 70cm
as well as 2m. I need some help on the description of noise
levels in the reciever. No preamps yet. Antennas are
Quadrifer Helix for 2m and a pair of twin QHelix's on 70cm (RHCP & LHCP).

I just need to know if this is good or bad and best of all what a
great signal should sound like. Maybe some suggestions on getting
to a great signal.

On 2m, beacons all over the place (SSB) all the way up the dial.
Some so loud they come in full quieting (5x9). On either side of the
beacons USB and LSB there are many different digital signals that vary
between 5x3 to 5x6 or so. There is really roughly 50% noise and
50% signal on the strongest ones. It seems there are even more signals
down lower. I have not tried to tune in the TNC yet. I am waiting on
a pre-amp. (Pin Diodes ?? noisy on XMIT ?)

On 70 cm, Crystal clear local signals repeaters etc. On going up the band
(from bottom)
the noise (back ground) increases at 440 to 443 and then back to normal
back ground.
Beacons are present but about 5x6 on the band as a whole. Near 440 (.0003~
FM) I can hear packet
booming in way above the noise but the signal has a little noise on it and
is not full quieting. (I may be off freq. a little). Should there be
signals all over
the place here too?
What does the increase in noise between 440 & 443 mean? Antenna mismatch ?
Match ? One antenna is not near as good as two.

Would you put a pre-amp on both 70cm antennas or join together.... ?

Its the pubescent pre-amp stage. Yuck.

SpaceNews originates at KD2BD in Wall Township, New Jersey, USA. It is published every week and is made available for unlimited free distribution.

* GROUND STATION VIA THE INTERNET *
==================================
For the past several months, Steve Bible, N7HPR, has been making a World Wide Web site available that carries up-to-date files and directories of some of the 9600 baud Amateur Pacsat satellites. Steve's site allows those without Pacsat groundstations the ability to explore the world of digital satellite communications on the Internet's World Wide Web.

Pacsat communications differs in many ways from terrestrial packet radio communications. One of the ways in which they differ is that Pacsat satellites are routinely used to pass image and software files between pacsat groundstations, in addition to text (e-mail) messages.

Steve recently added the capability of downloading images that have been uploaded to KO-23 and KO-25 from his World Wide Web Site. The images that are available are those that have been uploaded by other Amateurs around the world. Many of these images are interesting as they provide a look into the shacks and lives of those active on Amateur Satellites.

To see the directory listing of images, select either KO-23 or KO-25 from the home page (http://gndstn.sp.nps.navy.mil) and you will see the link to the image directory. Steve is currently working on making images from KO-23 and KO-25's CCD Earth imaging cameras available through his Web site.

Questions or suggestions regarding Steve's site may be directed directly to him at his e-mail address: srbible@cs.nps.navy.mil.

[Info via Steve Bible, N7HPR]

* NASA WEB SITE NEWS *
======================
NASA maintains an excellent World Wide Web site on the Internet. The URL is http://shuttle.nasa.gov. This site carries a wealth of information

on the Space Shuttle, including a link that provides images from NASA Television that are updated every few minutes during active Shuttle missions.

* OSCAR STATUS REPORT *
======================
UoSAT-OSCAR-11:
Normal ASCII/binary telemetry and ASCII news [145.826 MHz].

PACSAT-OSCAR-16:
Normal BBS activity.

DOVE-OSCAR-17:
Congratulations to DOVE for 400 days of uninterrupted service. S Band is currently OFF. TLM Rate may change as controllers continue to experiment with power settings. [Telemetry still every 30 secs]

WEBERSAT-OSCAR-18:
During the past week special wod collections have been taking place:

20:00 27-Jul-95 gathering/sending special WOD
0x16 battery 1
0x17 battery 2
0x18 battery 3
0x19 battery 4
0x21 BCR 10V
0x61 EDAC counter
digipeater on, uplink @ 145.9 MHz.

19:10 29-Jul-95 gathering/sending special WOD
0x1A battery 5
0x1B battery 6
0x1C battery 7
0x1D battery 8
0x21 BCR 10V
0x61 EDAC counter
digipeater on, uplink @ 145.9 MHz.

21:00 02-Aug-95
Collecting and Sending WOD Week4: Temps/Impact
0x14 rcvr +X temp
0x2F cell 1 temp
0x30 cell 2 temp
0x35 RC PSK HPA temp
0x3B impact counter
0x40 spect temp
Digipeater on, uplink on 145.9
73, KB7KCL
[currently broadcasting week4 temps/impact

LUSAT-OSCAR-19:
The BBS is open and available for normal use. The digipeater is OFF.

[Info via Graham, VK7ZO]

1666. DL0ART/am launch #2

Newsgroup: rec.radio.amateur.space
Date: 1995-08-08 00:00:00 UTC
From: Oliver Welp <welp@uni-muenster.de>
Message-ID: <406g2e$tsc@majestix.uni-muenster.de>
Source record: 24374

The Nienberge Amateur Radio Group (Germany) performed its second balloon
launch on sunday, 07-16-95 (I apologize for this late report: QRL hr!).

This was our announcement:
> We planned to have another emergency beacon with our regular balloon
> equipment, and it now is ready for a launch. Since we have some (smaller) spare
> balloons, we plan to do a launch with only this rig: 2 m beacon - no data, no
> remote control, no gas valve; just launching and parachuting (hopefully) "home"
> after bursting.

It should be a 2 - 3 hours flight.

Yes, that's what we intended... but, of course, the actual flight was totally different!

ARTOB launch 07-16-95:

Launch: # 2
Launch date 07-16-95
Launch time: 1201 UTC
Launch site: Nienberge near Muenster, NW Germany, JO32SA
Call sign: DL0ART/am
QRG/mod.: 144.991 MHz F1A beacon: call sign and info in FM audio CW,
in between freq shift slow (- - - - - - = balloon lifts) or
fast (......... = balloon is descending) (using a quicksilver
switch)
Power: 100 mW
Antenna: groundplane
Diameter ballon: ca. 3 ft
Gas: hydrogen
Parachute: ca. 5 ft
Weight: 490 g (over all)
Lift rate: ca. 200 g

(UTC)
11:00 Meeting of the team at launch site
11:20 weather data:
ground wind 14 knots, 240 deg
12:01 launch
12:10 DF teams start to their dedicated areas

The author had a hard moment when the parachute of the launched balloon did
not open immediately - but after a few moments, it did...

So far, everything was on schedule.

But it turned out that the ballon was drifting E/SE with quite a high speed.
The DF teams had a very hard time following. At 14:30 the balloon left quit

the area of the maps used by the teams (we use a very special system for giving DF results to the coordinator). Furthermore, the main DF coordintor, Joachim, DL3YBQ), had to head home and left us alone... I guess that was the moment when we lost (just a little bit) control of the situation.
And: the beacon signal still indicated the balloon lifting!

The DF teams continued following the balloon, but soon it is obvious that its speed was to high for us - most of the teams were just driving on highways in this rural area where we found ourselves. These roads seemed to lead anywere except to the place were the balloon apparently was... so we finally switched over to interstates. At about 18:00 most of us were in the Goettingen area (160 km linear distance), and still the DF results were unanimous: east!

East of Goettingen, the Harz begins - a secondary chain of mountains (summits up to 3200 ft). Another old man located in these mountains told us that his QTE also was - east.

So we finally decided at 18:30 UTC - that was 20:30 local time and about the time of sun set - to finish our hunt and go home.

What has happened?
Obviously, the lift of the balloon was not sufficient to bring it to a height where it would burst. We ae not sure if the gaz filling was insufficient or if maybe the parachute had slowed the lift so much that the balloon already lost too much gaz on its way up. It also passed a thunderstorm area, so maybe the balloon and the payload were covered with ice during some parts of its journey.

There also was another (so far) unexplained effect: about 2 hours after the launch, the beacon freq increased by abt 4 or 5 kHz, but decreased after 30 min by abt 6 or 7 kHz, increased again and so on. The transmitter was crystal-controlled, and was thermically quite well isolated in a styrofoam box - so what could be the reason?

But there also were some very positive things to tell: Since we used the local 70 cm repeaters for talk back (and quite a few of them during our long journey, hi), we drew the attention of many OMs to us, or better the balloon. Many of them help us with triangular DF or just told which roads to use and so (how do I get right across through Bielefeld - quite a large city - as fast as possible?). Even some days later, we heard OMs on our local repeater asking what had happened to the balloon, did we recover the payload and so on. That by itself was probably the biggest success of this launch - consider that ballooning is not that popular in Germany as it apparently is in the US.

HAPPY END!
Wednesday morning, Armin (DF1QE) got a phone call! The balloon had been found (by a non-ham) who already had seen this balloon right next to a road he passed on his way to work on monday morning. He finally became curious - so we were lucky!
I almost forgot (not relly, hi): he lives in Krina near Bitterfeld (formerly East Germany), JO62DP. So our balloon travelled a distance of abt 330 km. And the balloon never bursted - this explains why we had the signal for lifting during the whole flight. About ten days later, we got the equipment back (by mail).

Conclusions:

We will never start again on a such a windy day - yes, 14 knots is not that much, but the upper wind normally is twice as much, and that is defintely too fast to follow in an area that does not provide appropriate roads (e.g. leading to the balloon, hi).

Besides that, on every upcoming launch we will add a receiver to the equipment for remote control of a relaese unit for the payload (Guess why?).

Meanwhile, we are happy that we got the payload back (even if its value is limited). We got reception reports even from Bremen - a distance of about 100 km.

Any suggestion or response is always welcome!
Please tell me if you want to be added to our mailing list!

Best 73,
Oliver

1668. Problem with IC-820H

Newsgroup: rec.radio.amateur.space
Date: 1995-08-08 00:00:00 UTC
From: azki7lx@aztec.asu.edu
Message-ID: <4069ut$6u0@news.asu.edu>
Source record: 24376

I am having several problems with an Icom IC-820H. First, I am not getting any power out on SSB or CW. I have heard that two pins on the rear DIN connector might have to be jumpered. Does anyone know about this? Second, what is the key sequence to get the 'function' buttons to work.

1669. Help with MIR PBBS

Newsgroup: rec.radio.amateur.space
Date: 1995-08-09 00:00:00 UTC
From: wisznie@ecf.toronto.edu
Message-ID: <DD0z7y.JF@ecf.toronto.edu>
Source record: 24377

HI all. Thanx for reading this. Has any of you ever had a chance to hook up with MIR PBBS? If so, what frequency did you call on, what callsign is MIR PBBS, how easy is it to get on there and is any of that tracking software useful when trying to track MIR. I hear that because of the use of boosters to keep MIR in orbit, all calculations go screwy. Is that true?

Any help would be greatly appreciated.

1671. UPDOWN program

Newsgroup: rec.radio.amateur.space
Date: 1995-08-09 00:00:00 UTC
From: sufana@ceco.ceco.com
Message-ID: <DD1wFq.F40@ceco.ceco.com>
Source record: 24379

The other day I started to use the UPDOWN program (version 1.E) and noticed that the program may not be calculating the transmit frequency correctly when a Doppler shift is used. Can someone confirm if there is a problem or not?

Here is what the program produced when I entered the receive frequency and doppler shift frequency:

For RS-10 Mode A

Down Freq MHZ Up Freq MHZ Doppler KHZ

29.380 145.880 0
29.381 144.881 +1
29.379 146.879 -1

It is possible that I don't understand how to correctly take into account the doppler shift, but this looked real strange to me. I tried some other frequencies also and it seemed to put the transmit frequency out of band.

By way of test to see if I knew how to figure in doppler shift, I was on RS-15 the other day (close enough to RS-10 in frequency conversion) and made contact on 29.38048 MHz. Quiktrak indicated doppler of -202 HZ and my transmit ended up around 145.88470 MHz. This seemed to be what could be predicted by hand as
29.38048 + 116.504 - .202 = 145.884278. UPDOWN would have put me who knows where.

Thanks for any assistance.

Hi everbody,

I'm trying to receive APT transmitting satellites like NOAAx or METEORx-x.
My question.:

. Which satellites are operational on which frequencies. (APT transmitter)?

. Are there other satellites than Noaa and Meteor, transmitting APT-pictures
on the 137 MHz band, in low orbits?

Thanks in advance es 73

Mir callsign for packet is R0MIR-1.
It is best to have a short text message prepared on your computer
before calling the R0MIR-1 station. It should L(O)(O)K something like
this:

SP R0MIR < [your_callsign]
Greetings [title_of_message]
Short message for reliable throughput
that you have stored on your system.
Your signature and home pbbs info's should
they decide at some point to reply. Ya' never know.
/EX [to_close_the_message]

Once you receive the prompt from the R0MIR-1 pbbs,
then use you plain ascii upload to send the example above.

Tune in early for the signal, and about five Khz low is average
for the start of the pass, then as spacecraft approaches, tune to
center frequency of 145.550 Mhz for best results.

NB: Most likely the crew is sleeping after 5 p.m. local (edt) until
wee hours of morning, somedays listening during day you will also here
them engage in voice conversation.... ..

Hope this helps OM.... ..

Many 73

I'm look at trying meteor scatter for the first time. I have a 2 meter all mode radio.

Does is look like 2 meter contacts will be possible this weekend?

If so, when will each direction be possible from the southwest.
IE. What time of day do I work if I want to try the Midwest? Maybe North?

How strong of an outgoing signal is desired?

Does SSB work or is Dit Da necessary?

Your CW would have to be set for QSK, xmit freq locked
and you would adjust your rcv freq to compensate for
the Doppler shift of the bird as it flies by.

I might try that on my TS-140 someday.

Thanks for the idea!

I'm a Ham that getting more an more interested in satellite operation every day. What would I need to get started on satelite, and what will I need when Phase 3d comes out. (That would probably be a good time for me to get involved in space communications)

I'm interested in phone and digital packet stuff, although I don't have a packet setup for anything, yet. I'd need to get the TNC and everything else required for computer operation when I get into satellite.

Does anyone have any suggestions? Is there any good way of getting onto pacsats and oscar cheap? Should I wait 'till Phase 3d microwave is available?

Thanks for the help!

Hi, CW and SSB operation are both readily done with basic split freq operation.
I have worked RS12 with an FT747 (semi QSK) and dipole, both modes. Tune the
ant for the uplink. Keep in mind the uplink is in the 15M advanced phone
subband. I think you're better off with an omni antenna. A vertical would be
ideal, but the wire will work fine. You don't really need the gain and why
worry about aiming a tribander. You'll be busy enough following the doppler
shifted downlink with the rx.

> Does is look like 2 meter contacts will be possible this weekend?

Yes, though 6 meters will work much better.

> If so, when will each direction be possible from the southwest.
>IE. What time of day do I work if I want to try the Midwest? Maybe North?

The meteors will seem to come from the constellation Perseus, this is
called the *radiant* of the shower, so you'll have the most active
results when that constellation is in the path between you and the
other station. Consult an astronomical almanac or program to determine
the RA of Perseus from your station during the times you will be active.

Note, however, that meteors from the shower can appear anywhere in
your sky, and strongest signals may be obtained when operating at
right angles to the radiant. That's because the maximum extent
of the trail of a meteor travelling the radiant will be exposed
to you when viewed from the side. The most intense trails are
likely a couple of hours either side of dawn when the Earth's
motion adds to the meteor's velocity.

> How strong of an outgoing signal is desired?

More is always better, and especially at 2 meters where the average
trail is going to be underdense, strong signals can help. At 6 meters
and 10 meters, where many of the trails will be overdense, low power
works fine. But even at 2 meters there will be overdense trails, mostly
around dawn, just not so many of them, so low power will work.

> Does SSB work or is Dit Da necessary?

The average trail lasts less than 10 seconds, so you want the fastest
information transfer possible. Unless you're a lightning Morse operator,
SSB will be better. However, you pay a price in SNR for using SSB, so
some of the weaker trails won't be usable. Better would be a higher
speed digital mode. Lots of stations are going to try 1200 baud packet
on 145.79 during the shower. However, you'll do better with a more
robust and bandwidth efficient digital mode. A Pacsat PSK modem might
be just the ticket.

High gain beams are likely to be counterproductive. Their narrow
beamwidths will illuminate only a tiny portion of the sky. A meteor
passing outside that cone will be missed. Something with a wider
beam, say about 60 degrees, should work much better. If you have

a 3 or 4 element yagi, or a quad, try that. Even a vertical may
be effective. (Signal polarization will be twisted by the orientation
of the trail, so antenna polarization on the ground isn't significant.)

I've been too busy to rig up something better, so I'll be using
160 watts, 1200 baud, on 145.79 MHz into a vertical for this
shower. I may get excited enough to arrange better for the next
one, or at least get set back up on 6 meters.

This can be done, in fact, I worked someone a little while ago who as doing this rather successfully. The main problem is figuring out where to set the Tx and Rx knobs. He used a computer program to compute the doppler shift, and adjusted to what it said. He was a little off, but I could copy him without too much trouble. (This was SSB phone; CW should be easier.)

Satellite work is really intended to be done full-duplex (i.e. hearing yourself while you talk) so that doppler can be tracked accurately.

Hello Tobias,

At present NOAA 12 is on and uses 137.5 MHz, NOAA 14 is on and uses 137.62 MHz.
NOAA 9 is off at present due to polar coincidence with NOAA 14 because they
share the same APT channel. Unless something has gone wrong on NOAA 9, we
should expect it to return in a few days, as usual.

I hope this helps you,

A friend and I have been active on PACSATS for about 1 year. I chose to use a G5400B rotor on my system and haven't had any problems with it. My friend chose separate rotors for AZ and EL. For elevation he chose a G500. Although this rotor seems to be the same as the elevation portion of the G5400 that has worked quite well for me, he has had a lot of problems with elevation. His setup is well balaced to each side of the rotor and in the rotational plane.... and his wind loading is well within the G500 spec...

He has gone through 2 motors already. Is this normal for a G500? All aspects of his setup appear normal to me... I would appreciate any comments that people have on AZ/EL rotors and setups... especially any recommendations for heavy duty rotors ......

Thanks and 73 ...

This may seem silly, but it isn't intended as such. Is the G-500 mounted right side up? Upside down mounting is the #1 cause of problems with them. Water gets in.

It might help to know what failures have happened.

>Your CW would have to be set for QSK, xmit freq locked

Full QSK is probably NOT what you want. I've worked RS-12
quite a bit using my IC-735. If you try to use full break-in,
your're asking the rig to change bands in-between dits and dahs.
Relays clack, and I'm sure that you're transmitted CW sounds clipped
and chirpy. Best to just use the VOX and set the delay long enough
to hold between words.

>and you would adjust your rcv freq to compensate for
>the Doppler shift of the bird as it flies by.
>
A helpful trick to figuring out where to transmit, is to
try to listen for a local who is using the satellite, so
you can hear him on 15, and also on the downlink, and thus
determine what the offset is. I've found that the downlink
seems to be just a little "above" the uplink freq, perhaps about
500Hz when directly overhead. (I.e. an uplink of 21.220 MHz
results in a downlink of 29.4205 MHz. Doppler makes this greater
at AOS (about 1KHz) and less at LOS (almost the "same" freq)

I suspect this may change with the temperature of the satellite,
and over time...

Meg of memory and version System 7 or greater.

Each version 5 Ham Test Simulator has the latest questions
as prepared by the Question Pool Committee.

Each Ham Test Simulator is FREE OF CHARGE and work the
same way as the originals written by Diana, KC1SP.

You may obtain a Ham Test Simulator by mailing me a *FORMATTED
disk (1 per test) and include a Self Addressed and Stamped disk
mailer for the return.

The Ham Tests are now also available via America On Line.

Each Ham Test Simulator is also bundled with a shareware CW
program called MacMorse 1.4 written by Doug, WB0EON.

Also included are a collection of text files that relate an
interesting variety of ideas about the best way to study CW and
prepare for tests.

If you load these onto file servers where others can gain access
via Internet, please let me know so we can point others in that
direction.

Your comments and suggestions for future versions are always
welcome. Stay in touch and good luck with your next test!

73,

Tom Woolner (Tom@woolner.demon.co.uk) wrote:

: At present NOAA 12 is on and uses 137.5 MHz, NOAA 14 is on and uses 137.62 MHz.
: NOAA 9 is off at present due to polar coincidence with NOAA 14 because they
: share the same APT channel. Unless something has gone wrong on NOAA 9, we
: should expect it to return in a few days, as usual.

: I hope this helps you,

: regards
: --- Tom Woolner ----------

About August 3rd NOAA 9 was reported as having a possible battery/buss
failure. Diagnostics are being performed to see if the ol' girl is
finally down for the count. Hope it doesn't end up like NOAA 14 but then
#9 has surpassed it's design life by quite a few years too.

1697. NORAD Two-Line Orbital Element Sets (TLE656)

Newsgroup: rec.radio.amateur.space
Date: 1995-08-12 00:00:00 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.808193028@dolphin>
Source record: 24405

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (334) 409-9280, and are updated daily (when possible). Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at speeds up to 28,800 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily) and some documentation and software are available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space.news and rec.radio.amateur.space. This week's elements are provided below.

DEAR FRIENDS,

I would like to get more information about newsletter SKYNEWS, published by (?) North York Astronomical Association, in Canada. How to subscriber etc...?

All replies will welcomed. Can you help me!? Thank you very much in advance!

Vy best 73,

[]'s, Karl Leite, Natal/RN - Brasil

>(snip)
>He has gone through 2 motors already. Is this normal for a G500? All

I doubt it! I have had 2 KR500 (same as G500) for 14 and 7 years and no burn outs. I take it that the motors did burn out ? I have built into the control unit current sensing so that in the event of an overload the power is cut-off. This has helped to save the motor many times. Now I wonder why the manufacturer did not build it in ..... :-)

I dont have large antennas, just a 6XY 2meter and a 17XY for 70 cms.

The only problem I have had is water getting into the bearings and corroding them. I have since waterproofed them to try and prevent this in the future.

1701. AMSAT-UK

Newsgroup: rec.radio.amateur.space
Date: 1995-08-12 00:00:00 UTC
From: John@MCC.ac.uk
Message-ID: <40jfa4$5bt@yama.mcc.ac.uk>
Source record: 24409

Greetings,

I have set up a WWW page for AMSAT-UK, at:

http://www.mcc.ac.uk/AMSAT/

which has all the contact details for AMSAT-UK.

Also I have started to mirror the anonymous ftp sites of

ftp://ftp.amsat.org/amsat/
ftp://ftp.tapr.org/tapr/

which are accessible from my AMSTA-UK home-page.

At the moment the local information on the system is a bit
thin, but it will hopefully change soon.

John, G1YYH, AMSAT-UK 5701

I am in the process of setting up a 2m and 70m KLM antenna array. I have selected the Yaesu GB5400 antenna rotator. My question is this.
What is the max angle the antenna would be inclined to during the tracking process? By degree, for example I noted that the rotator control allows a 90 degree angle. Is the antenna ever really used at this angle? The reason for my concern is that mounting location that I have chosen maybe restrict me from using the antenna at 90 degrees. If I located the antenna on a higher mast, say 12 feet this problem would be solved, but it would become more of an eyesore to my neigbhors.

Also, do most Satellites tend to travel in a North/South pattern? Final question, how would this antenna be for use with ground based stations? Would I be better retaining my dualband vertical that I am presently using for gound communication?

Thank you for your reply. Email to HeadShrnkr@aol.com

Yes. There are many times that a satellite passes directly overhead.

Go for the extra height. Its worth the effort.

>
> Also, do most Satellites tend to travel in a North/South pattern?

Yes

> question, how would this antenna be for use with ground based stations?

It will compare very favorably with any normal beam mounted at the same
height.

> Would I be better retaining my dualband vertical that I am presently using
> for gound communication?

Yes, your verticle is omni-directional. Your satellite antennas are going to
be highly directional.

Bill

I'm wondering just what kind of circuit you used. I have designed a PC board for the G-500 (and others) that will allow it to be used with a computer just like the G-5400 box, and I would like to include an overcurrent protection. I have some ideas, but I would like to know about ones that are proven effective.

I wish the manufacturers would seal their units, and this includes pre-amps too. There is no longer any good reason not to.

1706. Request for info/help by missionary

Newsgroup: rec.radio.amateur.space
Date: 1995-08-13 00:00:00 UTC
From: Robin Mitchell <100641.2667@CompuServe.COM>
Message-ID: <40lebu$6m1$1@mhafn.production.compuserve.com>
Source record: 24414

The background.
My father is a missionary (Baptist) working in north-western Cameroon. He has a 486 class computer with modem and is trying to use Compuserve or Internet.

The problem
Frankly, the Cameroon telephone system. It can take up to sixty (60) attempts to reach the SITA site in Youenda (sp?). Note: SITA is a telex interface through which Compuserve can be reached. When a connection has been made it rarely lasts for more than ten minutes.

The request
Is it possible to connect to Compuserve and/or Internet via his own satellite ground station?

Thanks for any help that can be provided.
Apologies if this is not an appropriate forum for this request.
Flames to the big D!

Oops.. shoulda webbed first. For all those interested,
AMSAT WWW page: http://www.amsat.org/amsat/AmsatHome.html

the frequencies are
145.858 to 145.898 up,
29.354 - 29.394 down,
29.3525 and 29.3987 MHz beacons

1709. LNAs and Peltier Cooling

Newsgroup: rec.radio.amateur.space
Date: 1995-08-14 00:00:00 UTC
From: Kevin Shea <mashea@students.wisc.edu>
Message-ID: <40nglg$1b5k@news.doit.wisc.edu>
Source record: 24417
Cross-posted to: rec.radio.amateur.space,sci.electronics

Has anyone used a peltier thermo chip to cool an LNA to get lower noise?
I know this kind of thing is done in professional systems, but I'm wondering
can an amateur do it?

Specifically, I have a LNA for Weather Satellites (1.7 GHz) it has a noise
figure of less than 1.0 dB. Could I simply mount the pelitier chip on the
LNA box and cool it's contents? BTW it is a two stage LNA using a GaAs FET
for the first stage and a MMIC for the second stage. It will be mounted at
the feed on the dish.

Thanks for any ideas, comments or suggestions.

* "An Amateur Satellite Operation Upgrade Path" from the AMSAT Journal,
September/October 1993, pp. 24-26.

"A cousin to RS-10/11, RS-12/13 is also a 40 KHz wide linear transponder.
However, this bird is unique because its input frequencies are in the fifteen
meter band! This is also the only ham sat in the sky that requires more than
a code free technician license to work it, because its input band is from
21.210 - 21.250 MHz. This straddles the Advanced and Extra portions of the
15 meter band. Its output freqs are from 29.410 - 29.450 MHz. Because of
skip, this satellite can often be heard and worked when it's below the
horizon! At least one person has earned DXCC on this satellite! RS-12/13 is
bolted to the ?????? ???? satellite and its NORAD ID is 21089."
==========

In the following my statements reflect information I have read, been
told over the air (and via other ham forums) and found through direct
experience.

I was driven to upgrade to advanced specifically so that I could use
phone via satellite using RS-12/13. Contrary to popular gossip, AO-27
is practically useless. I am *rarely* able to hear it at all and then
it is usually almost completely unreadable. If I had to rate the very
best signals I have heard from AO-27 they would be 4x2. Note that I
do not have any expensive AZ/EL beams for sophisticated satellite
work.

On the other hand RS-12/13 is relatively easy to read in spite of a rumor I overheard over RS-12 that it is currently only transmitting about 1 watt of power. I have worked it using my TS690S with both a homebrew horizontal 40m dipole and built-in tuner, a discone that's only supposed to tx from 6m and up (also using tuner), and my current cushcraft vertical.

I initially set my vfo (A) to 29.430, then press A/B and set vfo B to 21.230 which is the start of the advanced area of the 15m band. Return to A, then press SPLIT. The display should read 29.425. Now if you press TF-SET you will see 8.20000 remember this number. USB is used exclusively for phone on RS-12/13 so if you are advanced and wish to use phone press USB. I have monitored CW but never attempted to use it myself as the doppler shift drift is much more annoying than on phone. If you are using CW the following should still work, its just going to be more effort fiddling with the tuning, also if you have the 500hz CW filter, don't try to use it, at least at first.

When the bird begins its pass the beacon will be one of the first things you will be able to rx. This is found "around" 29.408 mhz. It will be a little higher at the beginning of the pass. A minute or two after you first acquire the beacon, phone qsos may be found from 29.430 to 29.450 or so. CW is usually exclusively below 29.430 during the entire pass. If you hear a CW signal, don't tx phone anywhere near it (obviously). At this point I tune around until I find a strong qso or someone calling cq. Keep them in tune and shortly before you are ready to call them, press and hold TF-SET and tune until you see 8.20000 again. Now you are transmitting on more or less the appropriate freq for the other party to hear you. I have never failed to make contact using this method with stations that I can hear clearly. There is usually considerable qsb so I generally just exchange signal reports, first names, and grid locators. If the qso drags on you will need to tune to keep the other party readable. Retune your tx offset to 8.2 using the same procedure to keep your signal in the more or less the same area of the passband.

One interesting note: in my experience, fully 80% of the time I hear a good signal on the downlink, when I press the TF-SET button I hear the other party on the uplink *better* than on the downlink.
It's unfortunate that folks don't use 15m more often!

Comments welcome

Good luck and I hope to work you via RS-12!
Erik

Almost. The problem is that the entire unit must be hermetically sealed,
or it will fill with condensed moisture. It will sure help the first stage,
but the beneficial effect on the second stage will be less. You will
probably have to insulate the entire box except where the peltier cooler is
attached, and add a big heat sink to the hot side of the peltier device.
Good luck!

Besides being a great experiment in producing mold and fungii, you'll learn
a great deal about thermal expansion coefficients- if you can cycle the unit
low enough, and high enough, you might be able to pop some solder connections,
or maybe dislodge the mmic, unless the materials are matched.

let us know how you do!

If cost is not a problem, and I assume it is not since you are talking about a satellite ground station, I would suggest a link via INMARSAT. Portable suitcase type terminals are commercially available. Do you remember the broadcasts from downtown Baghdad by CNN reporter Peter Arnet (SP?)? He used a similar terminal to get his voice reports out after normal connections failed. The cost for satellite time is about $6.00 per minute. Once you are into an INMARSAT ground terminal, the world can be accessed.

Wouldn't the money be better spent on relief supplies and medical aid?

This message describes the rec.radio.amateur.*, rec.radio.cb,
rec.radio.info, and rec.radio.swap newsgroups, as well as their Internet
mailing list counterparts and complements. It is intended to serve as a
guide for the new reader on what to find where. Questions and comments may
be directed to the author, Jay Maynard, K5ZC, by Internet electronic mail at
jmaynard@admin5.hsc.uth.tmc.edu. This message was last changed on 31 October
1994 to add the discussion of non-Usenet mailing lists and streamline most
of the history discussion, and to change the moderator information for
rec.radio.info.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list
for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions
were held on the mailing list, and sent to the mailboxes of those who had
signed up for it. When the Usenet software was created, and net news as we
now know it was developed, a newsgroup was created for hams: net.ham-radio.
The mailing list and the newsgroup were gatewayed together, eventually.

Over the years, as the net grew, the volume of discussion became
progressively higher. First one by one, and then as part of two
reorganizations, what was once one group became many. In the process,
developments elsewhere on the net were reflected in the groups as they were
created, most notably the change to place all of the ham radio groups in one
hierarchy.

The collection of newsgroups continues to grow as more people join the net,
and as more topics of discussion gain volume, I expect to see more groups be
created as well. This follows what is happening on the rest of the net.

Nearly all of the radio newsgroups have corresponding mailing lists, the
notable exception being rec.radio.swap. There are also a few mailing lists
that don't have newsgroups.

The Current Groups
==================

It's important to post messages to the group that's appropriate for them,
and not to the groups that aren't. The whole idea of having different
```

newsgroups is so that folks who aren't interested in, say, homebrewing, don't have to wade through messages about homebrewing on the way to read about Field Day. Posting appropriately is just good etiquette.

The rec.radio.amateur.misc group is the catchall. It is what rec.ham-radio was renamed to during the first major reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, was removed on September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there. To answer a frequently asked question: No, there is no mailing list that goes along with this group. If you can't read Usenet news directly, you're out of luck.

The group rec.radio.amateur.policy was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate - it's now legal to order a pizza on the autopatch, if you're not in the pizza business - as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The group rec.radio.cb is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently David Dodell, WB7TPY. The email address for submissions to the group is rec-radio-info@stat.com. Inquires and other administrivia should be directed to rec-radio-info-request@stat.com. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups rec.radio.amateur.antenna, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

Mailing Lists

In addition to the mailing lists that mirror the Usenet newsgroups, there also are a few that stand alone. These cover specific areas of ham radio, and discussion is focused on just those areas.

The cq-contest mailing list is for discussions of contesting in ham radio. To join, send email with the word "subscribe" on a line by itself to cq-contest-request@tgv.com.

The DX mailing list covers the finer points of DXing. This one is also joined by mailing "subscribe" on a line by itself, this time to

dx-request@unbc.edu.

There's also a VHF mailing list, for VHF operators of the weak signal persuasion. You can join this one be sending "subscribe vhf" on a line by itself to vhf-request@w6yx.stanford.edu.

All of the following mailing lists are sponsored to the Boston Amateur Radio Club, as well as some others of local interest. Thanks to N1IST for the information.

qrp-l: This is the qrp mailing list, previously maintained by Bruce Walker at Think.com. It is for discussions about the design, construction, and use of qrp (low power) radios and related equipment.
arrl-ve-list: This is a one-way list, run by Bart Jahnke of the ARRL VEC, for announcements to VEs and VE teams.
w1aw-list: ARRL bulletins, news, and information
newsline-list: Redistribution of Amateur Radio Newsline
letter-list: Redistribution of the ARRL Letter
fox-list: Fox hunting and Radio Direction Finding
fieldorg-l: ARRL field organization discussions
ham-tech: Technical discussions and questions about Amateur Radio
arrl-exam-list: amateur radio license examinations scheduled in the US and in some foreign areas.

To sign up or inquire about these lists, send mail to listserv@netcom.com with the following in the body (subject is ignored) of the message.
<listname> is the name of the list to subscribe to.
To subscribe: subscribe <listname>
To unsubscribe: unsubscribe <listname>
For more information: help
To post (to the two-way lists), send your message to <listname>@netcom.com

Please do NOT send subscription requests to the mailing lists themselves; that doesn't work very often, and is very annoying to those on the list. Also, please keep your electronic mail address current with any mailing lists you subscribe to, as dealing with returned email is a nuisance for the person maintaining the mailing list.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while

still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

I talked to XE1XA Sunday night on AO-13. He said he is planning to
be active on AO10/13 from Easter Island from 2 Sept to 15 Sept. So keep
a look out for him. He didn't say if he'd be on any other bands.

In article <40nglg$1b5k@news.doit.wisc.edu>, Kevin Shea <mashea@students.wisc.edu> says:
>
>Has anyone used a peltier thermo chip to cool an LNA to get lower noise?
>Kevin
>shea4460@macc.wisc.edu
>
>Kevin, it would probably be less expensive in the long run to replace
the GasFet in the first stage with a lower noise device and to use a
GasFet for the second stage also. The Peltier cooler is not very effecient
and will require lots of current and a big heat sink for the heat side
Moisture will be a problem on the cold side due to condensation. I don't
have the numbers for noise figure vs. temperature handy, but the improvement
would be small from cooling unless you used some kind of liquid gas or
other method to get a large temperature reduction.

1720. Higher Speed Digital Satellites??

Newsgroup: rec.radio.amateur.space
Date: 1995-08-15 00:00:00 UTC
From: n9syw@w9yt.engr.wisc.edu
Message-ID: <n9syw-1508951752350001@f181-111.net.wisc.edu>
Source record: 24428

Are there any higher speed amateur digital satellites being planned?
(19.2k baud or faster) Adding 56k+ baud cability would greatly
enhance performance on low orbit satelites. It would allow modes like
digital voice and crosslinking of multiple satellites. I've heard rumors
that phase IIID might offer T1 speeds? That sounds great.
But it's unwise to have all our faster digital hopes based on one one
satelite with no backup. We should also be building relitivly cheap
high speed digital satellites in low to medium orbits.
Anyways I do hope the designers of phase IIID are planning for the
future and implement 1.5 Mbps channels. This would allow for some
very powerfull capibilities in amateur radio.

1722. Weather sat I.F. bandwidth

Newsgroup: rec.radio.amateur.space
Date: 1995-08-15 00:00:00 UTC
From: tonyshep@aol.com
Message-ID: <40rcjd$3f8@newsbf02.news.aol.com>
Source record: 24430

Anyone have a simple solution for increasing the IF bandwidth of a scanner to the required 40 Khz. Currently the scanner has a 10.7 Mhz crystal filter and a 455 Khz second IF filter. Would it be possible to construct 2 or 3 pole passive band pass filters with surface mounted components to replace these? Any ideas would be appreciated.

Email- Tonyshep @AOL.COM

The DRIG bbs has an artical for converting the BC100 into a wefax
receiver. Basicaly(if I am remembering correctly) they just replaced
the 455kc flilter with a 0.01uF cap. Spec-com ran a conversion for
the Kenwood R2000 that did the same thing. The R2000, a sw rig, also
had an optional VHF converter as sort of a plug in. The Specom artical
showed a way to have your cake and eat it too. They used a small DPDT
relay to either have the 455kc or the 0.01uF cap. I suspect that the same
idea might work for the Pro2004/5/6. The advantage of this over the
BC100, is the BC100 also required retuning the IF. If memory serves
me, you tunned to the other conversion product up ?2X10.7Mc? and rebais
the RF front end. The BC100 would almost have to be dedicated..of course
the BC100 should be cheap these days.
If you need the DRIG phone number and file name, just drop me a line.
Either here or Email. I do not have it here, but should still have the
data at home.

I'm still looking through the log file. It turns out that 145.79 is
the local APRS channel, with what looks like a HF gateway active.
I've got lots of packets recorded, I just dumped passall to a file,
but I don't know if any were via meteors. Because the channel is busy,
I didn't try to transmit.

>I had mine on receiving all weekend with a horizontal

The .1 uf cap fix will sort of work (That's what I started with) but the
IR images will not be good at all. The IR images are much brighter and
that makes the modulation wider. I was getting excellent images of
visable but not IR. Multi-Fax is roumored to be comming out with a new
converted scanner but unlike Spec-Com they are DESIGNING new IF's for it.
THey will be using double tuned IFs like Vanguard. Thus you get a
synthisized, sensitive receiver in a nice enclosure that can even receive
the weather broadcasts. I don't know what they will be asking for their
new receiver but it won't be much and it will WORK! I can't wait to place
an order!

>I am looking for a program which is able to decode the NOAA signals (for
>PC)? Who knows such a program? From where can i get it?

Chris,

JVFAX 6.0 or roundabout does just this rather well. It's a PD
program on the HAM-FTP sites. Only you need a hardware decoder
to digitize the AM audio. The "Harifax" is quite cheap and good.

There may be programs around that work with a soundblaster, not sure though.

JVFAX 7.0 is out and is better than 6.0. If you have a real Sound
Blaster card, try the SBDSP. There are atleast two versions. You will
also need APTCAP40. I think both the ARRL and AMSAT ftp sites have both.
I have not had any luck with this route. I suspect that I am just miss-
understanding something.
The JVFAX route works great. It is at the AMSAT ftp site. It works
best with a real am demod feeding an a>d converter. But the author
includes a diagram for a ?2211 am demod>>fm mod that you feed to a simple
op amp circuit. It will cost you less than $10(us) or so to get up by
the "simplest" route.
Mr. Felix looks great out in the Atlantic(via NOAA 12).

Tony, this is not an answer to your question about the homemade filters but i do know that you can purchase the 40khz filters from Hamtronics, Hilton, NY. They sell a set of the 455khz and 10.7 mhz filters for around $25 for the pair. I have modified several receivers just by by-passing the 10.7 mhz filter with a 470 pf capacitor and then purchasing a 40khz filter for the 455khz. This gives very usable results.
Also i have obtained very satisfactory results with just a standard off-the-shelf receiver.

Hope this is of any help!

1736. BBC World Service on Satellite

Newsgroup: rec.radio.amateur.space
Date: 1995-08-17 00:00:00 UTC

Cross-posted to: rec.radio.amateur.space,rec.video.satellite.dbs,rec.video.satellite.misc

Hi, satellite folks. I know close to nothing about satellites, so please bear with me on this question.

I'd like to know what the cheapest/easiest way to receive the BBC World Service via satellite in the United States is. My father-in-law and I were wondering if the new RCA 18" dishes would suffice or not.

BBC World Service to North America is on Satcom C3, 131 degrees West, C-Span transponder, vertical polarisation, 3.840 GHz on an audio subcarrier frequency of 5.41 MHz.

I'd appreciate direct responses (I'll be make a few trips here and there and could get behind in newsreading) so we can also conserve bandwidth -- I'll summarize if there's interest...

Thanks in advance,
Dipesh

>Is it possible to connect to Compuserve and/or Internet via his
>own satellite ground station?

Certainly not via amateur radio satellites. You might get store and forward email facilities via the VITA or SATELIFE satellites (sorry I dont have a contact number / address).

I guess the other option is an Inmarsat type portable telephone mobile uplink. Probably expensive but it should work. It did work for the UN inspectors that got blockaded in Iraq some time ago.

>>I have built into the control unit current sensing so that in the event of
>>an overload the power is cut-off.
>I'm wondering just what kind of circuit you used. I have designed a PC board

Its not my design. It is part of a larger design for computer antenna control
from VHF Communications magazine 4/1979 Yes 79!

The return current from the motor passes through 3 x 1 ohm 1 Watt resistors in
parallel, the voltage so developed is applied to a pre-set pot to vary the
cut-off point and the slider goes to the base of an NPN transistor.
This is bufferd through another transistor, which in the event of an overload
operates a self-latching relay to disconnect the 26v ac to the motor.

If you are interested I can always draw up a rough diagram in GIF / JPG and
uucode it. I only have email facilities here.

>>The only problem I have had is water getting into the bearings and corroding
>>them. I have since waterproofed them to try and prevent this in the future.
>I wish the manufacturers would seal their units, and this includes pre-amps
>too. There is no longer any good reason not to.

Now surely you dont need me to tell you why they dont :-)

As for pre-amps, over this side of the pond there is a company called Mutek
that makes excellent pre-amps in IP rated enclosures. I have 2m and 70 cms
units of theirs and no water problems. (Or at least I did not until I wrote
this !)

Subject: Higher Speed Digital Satellites??

Are there any higher speed amateur digital satellites being planned?
(19.2k baud or faster) Adding 56k+ baud cability would greatly
enhance performance on low orbit satelites. It would allow modes like
digital voice and crosslinking of multiple satellites. I've heard rumors
that phase IIID might offer T1 speeds? That sounds great.

But it's unwise to have all our faster digital hopes based on one one
satelite with no backup. We should also be building relitivly cheap
high speed digital satellites in low to medium orbits.
Anyways I do hope the designers of phase IIID are planning for the
future and implement 1.5 Mbps channels. This would allow for some
very powerfull capibilities in amateur radio.

The DRIG bbs has an artical for converting the BC100 into a wefax
receiver. Basicaly(if I am remembering correctly) they just replaced
the 455kc flilter with a 0.01uF cap. Spec-com ran a conversion for
the Kenwood R2000 that did the same thing. The R2000, a sw rig, also
had an optional VHF converter as sort of a plug in. The Specom artical
showed a way to have your cake and eat it too. They used a small DPDT
relay to either have the 455kc or the 0.01uF cap. I suspect that the same
idea might work for the Pro2004/5/6. The advantage of this over the
BC100, is the BC100 also required retuning the IF. If memory serves
me, you tunned to the other conversion product up ?2X10.7Mc? and rebais
the RF front end. The BC100 would almost have to be dedicated..of course
the BC100 should be cheap these days.
If you need the DRIG phone number and file name, just drop me a line.

Relatively cheap????? That qualifies as an understatement in the same class as "Houston, We've had a problem".

I would certainly like more high speed digital satellites, but are you aware of the cost and effort invovled in building and launching such a bird????????

If the AMSAT members want such a project - and are willing to fund it, then it would certainly be an excellent project for the future, after Phase 3-D is in operation. In some ways it might even be easier to operate.

But I think you've underestimated the effort needed to do such a project.

I am in favor of higher speeds as well. The load on the present 9600 bps sats is maxed out when they are over populated areas. The biggest problem is in getting enough power to put out a readable signal from the satellite. The size of the sats are very limited, and there is only so much area for solar panels. There are some modulation schemes that conserve power, but the cost of the modems and special RF gear is pretty extreme.

>I've heard rumors
>that phase IIID might offer T1 speeds? That sounds great.

Actually, user links will probably be at 9600 bps. These will link to groundstations through the satellite at high speed (64k) and allow for some really BIG storage availability.

It would be nice, but the expense to a ground station to be able to receive at that speed would be very large. There's a lot more to it than just a $300.00 modem. 64k is starting to come down in price, and will much more now that ISDN is (finally) coming around. For now, I think it best we take it one step at a time and try for the 64k and get that tested and affordable. Then, lets move up some.

The answer is yes, if you can afford it. This type of termo electric
coolers are multi-stage Peltier-cascades. (single stage coolers do not
give a temperature difference enough) Those cascades look like small
pyramids, where the coolest surface is the smallest, because underlying
elements cool the preceeding, including their losses. All surfaces but the
outermost must be thermally isolated in a tight fashion, (use thermal
foam) in order to minimize dimensions (cost). The temperature limit is
somewhere between -90deg C to -100deg C. This makes them excellent
replacements for liquid nitrogen. The Peltier type of cooler is frequently
used to cool IR-detectors. First stage cooling of radio receivers are more
often done at considerably lower temperature and this excludes the TEC
although the use of this kind of cooler could not be more simple.

73 Magazine July 1990 p. 42 "Turnstile Antennas"

This article is what you are looking for. It uses RG-62, 100 ohm coax for the phasing line. Length for 28.5 MHz is listed as 82.76 in. and dipole length of 98.5 in. Satellite Experimenter's Handbook also has a short article, chap. 8 p. 17., 2nd ed.
If you can't find RG62 at your normal source, try a computer calbe or network installer. It is usually used in network apps. I salvaged 200 feet from a remodeled office building.

If your noise figure is already less than 1.0 dB the most you can expect
to gain is a few tenths of a dB in SNR. It hardly seems worth the time or
trouble.

My employer used some Peltier coolers on a Ku-band GaAs FET LNA in the
early 1980s. It was a military project that has deep pockets. One of the
problems they had was that the LNAs kept icing up. Within a few years
there were GaAs FET amplifiers on the market that achieved lower noise
figures without cooling than the expensive and troublesome cooled ones
that they built.

Cheers,

: also need APTCAP40. I think both the ARRL and AMSAT ftp sites have both.
: I have not had any luck with this route. I suspect that I am just miss-
: understanding something.
: The JVFAX route works great. It is at the AMSAT ftp site. It works
: best with a real am demod feeding an a>d converter. But the author
: includes a diagram for a ?2211 am demod>>fm mod that you feed to a simple
: op amp circuit. It will cost you less than $10(us) or so to get up by
: the "simplest" route.

JVFAX does work well, but with the simple opamp decoder it only works on the FM Fax signals, i.e. HF WEFAX. If you happen to live in the wrong place (as I do), you may not be able to hear the station you want. I can get really nice images of weather out in the Atlantic Ocean, or over in China, but the west coast (Tx in San Francisco, I think) can't be heard from my QTH.

The SoundBlaster + SBDSP may work better - I've only tried it on one pass, and got a rather wierd image. Definitely needs work. But there WAS an image!

For the IF Filter problem, check out EEB. The Icom R-7000 receiver I purchased used had a 30khz (?) filter added in place of one of the stock ones by them.

Good luck,

Greg KO6TH

I must correct my own statement. With the cold sky as background, cooling the LNA could potentially produce an SNR improvement greater than 1 dB. (Sorry about the slip...I'm more accustomed to thinking about downward-looking systems.) Good luck if you try it.

From: regross1@aol.com
Message-ID: <413fvs$fif@newsbf02.news.aol.com>
Source record: 24464

I am considering ordering the 2m and 70 cm set of eggbeater antennas from M-square and am looking for someone who has actually used them for satellite communications. I plan to use them with an ICOM 820H and two TE Systems 160 watt output amplifiers having internal preamplifiers. Premium coax in anticipated in lengths of less than 75 feet.

How effective are they? What are their benefits and limitations. I expect to ultimately have to use them in a housing development with covenants against outside antennas. I would consider putting them high in the attic. If you have any experiences with a similar arrangement, please share them.

I've got the 2 meter m2 eggbeater- works well. I've used it to work the Shuttle and MIR on 2 meters, running about 30 watts into 50 feet of 9913. Also use it for 137 MHz WX sats. Here in Silicon Gulch, the 28 degree shuttle orbits only give us about a 12 degree elevation at maximum- so the antenna works well down low as well as on overhead passes for the wx birds. I'd like to put a preamp up on the mast, but around here, I'm going to need filters (probably switchable) ahead of the preamp to cut down on local noise (I'm still looking for something that's effective for dealing with louts keying up on the downlink).

> class as "Houston, We've had a problem".

A microsat is incredibly cheap compared to a large satellite
like phase IIID. A larger satellite requires its own launch
vehicle and can no longer 'hitch a free ride' as a secondary
payload. The store and forward microsats have been one of the few
recent contributions amateur radio has made to the radio art.
At the moment there are very few American digital hamsats and
no high speed ones that I know of (9600+baud). I would like to
know what groups are planning and building the next generation
of digital satellites??

> I would certainly like more high speed digital satellites, but are you
> aware of the cost and effort invovled in building and launching such a
> bird????????
>

I'm not talking about building T1 speed microsats! Speeds in
excess of 56k bps probably would not be very practical with
current amateur microsat technology. But we should try and match
new oportunities for satellites with the best currently available
technology and I don't mean what the Japenese radio makers are
selling.
Replacing the FM DFSK type downlinks with a much more robust
modulation schemes and error correction would allow 2-6
times the speed at similar power levels when used with high
quality receivers. Assumming the team building the satellite
has mastered the basics of constructing space worthy satellites
adding higher speed digital capibility is a small fraction
of the launch cost or spacecraft cost.

> If the AMSAT members want such a project - and are willing to fund it,

> Phase 3-D is in operation. In some ways it might even be easier to
> operate.

>
> But I think you've underestimated the effort needed to do such a project.

The effort needed is a willingness to make the most of the oportunities
available and push amateur radio into the future. Nothing decent ever
comes without hard work.

The R-7000 would not be appropriate for these modes. It tunes in 100 hz steps, while 10 hz is needed for psk. It can work for FM AFSK, but I have noticed that the sensitivity is not very good. I use mine for weather sats (with much modification), but with even these relatively high powered signals, I need one extra stage of RF amplification. For PSK, the modems all use tuning inputs to the radio, and the R-7000 has no provisions for that.

These are great as scanners, but leave something to be desired for serious data signal reception. I think it would be better to stick with a radio that is intended for Amateur band usage. They will be optimised for the intended band, with better performance than a wide coverage scanner type unit.

Michael,

Have a look in ftp.demon.co.uk /pub/ham/mac

in there you'll find at least 2 sat tracking programmes (and lots of other Mac stuff by the way).

Hope this helps,

Sean.

1768. New Macintosh Ham Test Simulators

Newsgroup: rec.radio.amateur.space
Date: 1995-08-21 00:00:00 UTC
From: john@wd1v.mv.com
Message-ID: <john-2108950531440001@wd1v.mv.com>
Source record: 24276

The new Macintosh Ham Test Simulators are HERE!

Novice Ham Test 5.0 SA.sea
Technician Ham Test 5.0 SA.sea
General Ham Test 5.0 SA.sea
Advanced Ham Test 5.0 SA.sea
Extra Ham Test 5.0 SA.sea

The latest versions feature:

HyperCard 2.3 as a stand-alone application (SA) eliminating the need to have HyperCard. All you need is a Mac with 4 Meg of memory and version System 7 or greater.

Each version 5 Ham Test Simulator has the latest questions as prepared by the Question Pool Committee.

Each Ham Test Simulator is FREE OF CHARGE and work the same way as the originals written by Diana, KC1SP.

You may obtain a Ham Test Simulator by mailing me a *FORMATTED disk (1 per test) and include a Self Addressed and Stamped disk mailer for the return.

Each Ham Test Simulator is also bundled with a shareware CW program called MacMorse 1.4 written by Doug, WB0EON.

Also included are a collection of text files that relate an interesting variety of ideas about the best way to study CW and prepare for tests.

or warm your phone line and get just the tests:

America On Line - Macintosh Ham Radio Section

ftp://oak.oakland.edu//pub3/hamradio/mac/theory-and-morse/AdvancedHamTest1.sea.bin
ftp://oak.oakland.edu//pub3/hamradio/mac/theory-and-morse/ExtraHamTest.sea.bin
ftp://oak.oakland.edu//pub3/hamradio/mac/theory-and-morse/GeneralHamTest.sea.bin
ftp://oak.oakland.edu//pub3/hamradio/mac/theory-and-morse/NoviceHamTest.sea.bin
ftp://oak.oakland.edu//pub3/hamradio/mac/theory-and-morse/TechnicianHamTest.sea.bin

Your comments and suggestions for future versions are always welcome. Stay in touch and good luck with your next test!

Not to mention the $$$$$ spent on each user's ground station in the
necessary upgrades to Tx & Rx reliably @ T1 rates. Guess I'd better start
looking for a good used Microdyne 1400-MR receiver...(g)

1772. SatPasses home page and Canadian cities

Newsgroup: rec.radio.amateur.space
Date: 1995-08-21 00:00:00 UTC
From: manfred@ssl.berkeley.edu
Message-ID: <41abql$9k1@agate.berkeley.edu>
Source record: 24280

Over the last few weeks I received several requests to add
Canadian cities to the SatPasses home page that shows predictions
for Space Shuttle, Mir, HST and UARS passes for presently 53
U.S. cities. To do this consistently, I would need to know the
Canadian time zones for the following cities:

Calgary, AB
Edmonton, AB
Montreal, PQ
Ottawa, ON
Quebec, QC
Saskatoon, SK
Toronto, ON
Vancouver, BC
Winnipeg, MB

Also, is daylight savings time observed everywhere in Canada?

Thanks very much!

From: headshrnkr@aol.com
Message-ID: <41ae2u$cl1@newsbf02.news.aol.com>
Source record: 24282

Hello.

I have a few questions about sat. tracking software and modems. First, let me describe my current setup. I have a ICOM 820H transceiver, a KLM 2m and KLM 70cm antenna setup on a Yaesu GB5400 rotor.

First, can anyone make a suggestion as to a good tracking program for DOS or Windows? Either commerical or shareware is fine.

Second, I would like to have my rotor controlled by software, suggestions? Possibly a tracking and rotor control software package?

Third, I do not understand the exact equipement required for digital transmission and reception. I am familar with Packet and use a PK 232 but the standard is different for the Digital Satellites? Is there any way to use or modify my PK 232 to function in this manner?

I appericate your reply. If possible email to HeadShrnkr@aol.com.

1778. NORAD Two-Line Orbital Element Sets (TLE660)

Newsgroup: rec.radio.amateur.space
Date: 1995-08-22 00:00:00 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.809056510@dolphin>
Source record: 24286

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (334) 409-9280, and are updated daily (when possible). Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at speeds up to 28,800 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily) and some documentation and software are available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space.news and rec.radio.amateur.space. This week's elements are provided below.

>
Probably not by Amateur satellite, but by Inmarsat, which is a commercial system. I don't have any information on how to get started using the system except that it uses a frequency of around 2Ghz and you need a small (2-3ft) dish to access it. I believe the system is intended to be used primarily by underdeveloped countries for emergency medical communications.

There are some systems designed to be used by ships for telephone traffic that could be used by individuals if they were willing to pay the price. Contact a marine radio salesman through a local marina for information. If your friends are in range of the Japanese digital cellular satellites, they could use them for worldwide communications. I don't think the US has its system in place yet.

There are Gateways from Ham satellite to Internet, but they are NOT used for the purposes you described. Also the access is not good due the orbital mechanics. There are just not enough Ham Satellites to be overhead when you need them.

1784. Email by radio from Yacht - HELP?

Newsgroup: rec.radio.amateur.space
Date: 1995-08-22 00:00:00 UTC
From: geoff@aladdin.co.uk
Message-ID: <41cmgg$dmg@etech.aladdin.co.uk>
Source record: 24292
Cross-posted to: rec.radio.shortwave,uk.amateur.radio,rec.radio.amateur.space,alt.radio.digital

I am not an amateur radio person, but have some understanding of technology, unlike my friends. They are retired and sailing slowly round the world on 37' yacht (currently ashore for winter in N.Z.)

I am informed that there is the possibility of sending email via radio to amateur satellites which then can connect into good old internet/compuserve......from a laptop or similar on board. The have a radio which from N.Z. they could "talk" to mid USA and as far west as Austria, so presumably it is quite powerful. They want this facility to be able to leave email for their agent in UK so they can get spares ordered before they get into port.......

Anyone any ideas if this is so , and if so, how do they go about it?

Any info gratefully recieved. Please email me as well as posting any response for the education of others.

Thanks a bunch in advance, geoff@aladdin.net

I am sorry but I do not have a reference, but the Molniya satellites
used to use a form of sound in vision in which the sound channel was
carried as a pulse (width, position modulated?) in the sync area od the
flyback of each line. A demodulator was described in a radio magazine about
ten years ago, but that I am afraid is all I can remember.

Hi Rob,

Did you purchases the optional radials? If so, can you tell me the length
of them? I'm trying to build a 144 and 440 mhz eggbeater and can't find the
formula for calculating the length of the radials.

Also, have you worked any other Sats like AO-27 or AO-13 with the eggbeater?

Thanks,
Kory

From ARRL Headquarters
Newington, CT August 23, 1995
To all radio amateurs

SB SPACE ARL ARLS012
ARLS012 Amateur radio on Mir

German Cosmonaut Thomas Reiter, DF4TR, will join the Russian space
station Mir, and operate signing DP0MIR, during the European Space
Agency's ''EUROMIR 95'' mission beginning September 2, 1995.

Reiter will use the 2-meter FM rig aboard Mir during the 135 days
planned for his flight. Primary frequencies to be used (preferably
in split mode) are 145.800, 145.550, and perhaps 145.200 MHz.

QSLs for DP0MIR should be sent to DARC QSL bureau.

1792. Re: Molniya over the pole?

Newsgroup: rec.radio.amateur.space
Date: 1995-08-24 00:00:00 UTC
From: Ben@mn.interact.net
Message-ID: <41i332$ber@sven.mn.interact.net>
Source record: 24300

In article <DDs0o7.Ayz@emr1.emr.ca>, stephens@ngis.geod.emr.ca (Dave Stephenson) says:

Russian television via Molniya (Lighting) C-band satellites is SEMI-HARD.

problem 1) Non geosync orbit requiring active tracking with ALT/AZI pointing.
Note a fairly cheap computer can do this ie) Apple][, although
I have heard stories of people MANUALLY re-pointing their dish
every 15-30 mins.

Problem 2) Need a fairly big dish, 10' minimum, 16-32' preferred.

Problem 3) SECAM TV format. can be displayed on multiformat monitors.

Problem 4) Audio not above video but mixed into horiz blanking area.
Note: This has been fixed by them adding 2nd audio signal
above video signal to be more compatable with cheaper
western TVRO RX gear.

Problem 5) Language in Russian. Although the pictures are nice. Its weird
seeing Fraggle Rock dubbed in Russian but they SING in english.

Problem 6) Ocassionally one or more of the Four satellites in the constillation
is 'on the blink'.

Several colleges have a setup to receive this for their Russian Studies.
if you see a dish NOT pointed to the SW, SE or S but to the NE then they have
such a setup. U of IA and Crighton in Omaha come to mind.

There are a few firms out there that will sell you a turnkey system installed for
about $50,000-$100,000.

If you live EAST of the Missippi or better yet east of the OHIO river vallely
you can pick up the signal from their Geo-sync birds.

Hope this helps.

I check into the Molniya satellites awhile ago, and found that the
satellites are no longer transmitting TV signals. I cannot personally
confirm this.

Dave, it is my understanding that the orbit being eliptical and having redundent birds (I believe there were
three), another bird is in the beamwidth of your dish before you lose signal from the first. The other problems
agree with my what I have read.

Hi. I've been using a Yaseu 5400B for years but now am having a problem. The azimuth reading (via KCT) is wrong. I checked the output of the 5400's din plug and indeed the voltage is jumping several volts in a random pattern. The elevation is working just fine. One last thing, the analog display on the 5400 does show the proper az position. Anyone ever have this problem? Thanks, Chris N8UDK

1797. JVFAX APT CONFUSION

Newsgroup: rec.radio.amateur.space
Date: 1995-08-25 00:00:00 UTC
From: tfugate@pop.uky.edu
Message-ID: <41kkoe$27h@service1.uky.edu>
Source record: 24305

I have received several Emails concerning a reply that I had made
regarding NOAA APT reception with JVFAX 7.0. I was told that
"you can only receive hf style sefax with the 'simplest' demodulator"
Diagram AMFMFAX.GIF show a circuit using the XR2206. This is a
converter that goes in front of the op-amp cirucit. It detects the
AM NAOO APT FAX and CONVERTS it into a FM(HF) FAX signal. The diagram
text is in GERMAN but the circuit does work and works fairly well.
It is a full wave detector driving a VCO. There is a graph,
AMFMFAX1.GIF, that show the transfer curve. It is reasonalbly linear.
I used a 8ohm to 1000ohm transformer. I used a 2n2222 for T1.
While I now use a better demodulator, I decided to keep this one around
for field operation.
TO any and all that emailed me, I am sorry to reply this way, but UK is
having MAJOR mail problems. They switched us all from CC mail to Eudora.
I have had a nightmare trying to post mail off campus and have been
told by freinds that a lot of mail sent to me is bouncing. Our campus
access to the news groups has been kind of spooty also.
The bottom line is this simple method does work. And, while a better
demodulator is a real good idea, you can toss the "simplest" adaptor and
the xr2206 converter togather in a evening. The only problem that the
simplest/xr2206 had was in saving. My old pc, a 20mc 80386, just got
"lost" while trying to save images.(or it might have been the MAXTOR
hard file..it was a GREEN energy saver that would auto-spin down.
You could hear the drive stop and then tJVFAX would lock up..sometimes)
I tried it again last night on NOAA12, I had a good 50 degree pass last
night, and captured the entire pass with the simplest/XR2206 demod.
I currently have a 80486DX66(I use the maxtor as my boot drive(c:) and
capture to a seagate 80meg). Give it a shot. It is a thrill to see your
first capture.
Oh, and don't try to record the pass on audio tape and expect to play
it back and captur it after the fact. Almost all audio tape recorders,
either reeel to rel or cassette, have so much wow and flutter that the
resultant image will be barely if at all usefull. You might be able to
record the pass on a VHS vcr and play it back. Be sure to feed a good
stong clean local video signal in the video input.(most home vcrs will
allow you to tune in a local tv station and plug in an external audio
source). VCRs have a seperate control track that might keep the tape
speed constant(or least close enouge for our purposes). I have had good
luck with a borrowed NAGRA reel to reel audio recorder. The NAGRA was
designed to be used with a file camera and has a 100hz crystal
refferenced audio track. During playback it "locks" the tape speed to
the internal clock. I mention this just to save you the frustration that
I have already been through in trying to tape a pass.

If you have a BEAM that wide you need REALLY good signal processing to
get the signal back out.

Most dishes have a beam 1-2 degrees wide, about 2-4 full moon widths.
It's a BIG sky, over 25,000 places to point and only a few will work.
The satellites are NOT that close together. EVERY working system
I've seen has ACTIVE alt-azi pointing that updates the position every
few seconds. The Apple][system used TLEs to get close when the bird
came up then used a 'random move'/ signal strength check to track.
(hey... it worked...)

BTW:
Problem 7:
There is a few minutes of signal dropout when EVERYBODY switches to the
NEXT 'rising' satellite when the current one 'sets'.

Sorta like our Geosync Sun outages except it happens several times each
day.

Problem 7) They have circularized (left/right)polarization and we have
linear (horiz/vert) signals. Yet another adaptor required.
Actually just cram a 'special' piece of plastic in your feed
horn.

Problem 8) There is a few minutes of signal loss every 6 hrs or so when
EVERYBODY switches from the setting satellite to the Rising
satellite. Sorta like our solar outages except its several
times EVERY day.

: agree with my what I have read.

: Ken mbv@ti.com

I did not ask the original question. Yes the Molniya birds are in
Molniya orbits ( what else) and usually have 3 operational birds plus
one running spare plus some stand bys. Of course there are also the
military com sats and presumably still some U.S. jumpseats up there
chasing each other in orbits similar to the initial orbit of Oscar 13.
The problems of tracking a Molniya should be about the same as tracking
Oscar 13 with a microwave dish.

Thanks for bringing me up to date on those birds.

Freq.s up/downlink for the vessel are in 1.5Ghz/1.6GHz, duplex distance
100Mhz.

Best for ur purpose is Inmarsat C. wich can run completely from 24V DC.
Antenna is small and not a dish but a Qudrifiller type antenna.

The Inmarsat C system is using a 600Bps up down link and is a store and
forward system. You can send/receive Msgs frm INT telex network, PSTN,
AX25 etc. You can also send an ASCII datafile to a fax machine ashore.

Best sold unit is from Thrane & Thrane in Denmark. Unit is sold
worldwide.

Sending receiving MSG's to the Internet is possible on some
coaststations, but is quit experimental on the moment of writing using
the X400 network.

>There are some systems designed to be used by ships for telephone
>traffic that could be used by individuals if they were willing to pay
>the price. Contact a marine radio salesman through a local marina for
>information. If your friends are in range of the Japanese digital cellular
>satellites, they could use them for worldwide communications. I don't think
>the US has its system in place yet.

There is also INMARSAT-M terminal, especial disigned for Portable work
and/or use ab a high sea going small vessel. Usage Telephony and low
speed FAX (2400 Bd), later on 2400Bd data will be added. 24V DC working
possible. No gyro compass needed.

For larger vessels there is a full size INMARSAT-B including full duplex
telephony, Telex, FAX at 9600Bd and DATA at 9600Bd.
The INMARSAT-B will replace the older INMARSAT-A.
For this equipment an AC supply (220V or 110V 50/60Hz) is needed aswel
as a good functioning gyro compass. 24V Emergency supply also available

for distres puposes.

INMARSAT has a worldwide coverage with 4 Stationairy satelites.

If you can afford it, Instant Track is propably the best tracking
program. Do a net search for amsat. I think you have to order it
via the phone with a credit card. Several of the sat gurus around here
use it. At the Amsat.ftp archive they have several different freeware/
shareware trackers. I know that IT supports computer control of your
rotor. I use PREDICT.EXE, it is a freeware text only tracker, schedular.
You can get the orbital elements for the airforce ftp. Since I switched
to netscape I can not quickly find net addresses. Do a net search.
Yesterday I downloaded a new(for me) tracker. STSORBIT. It appears
(from reading the docs) to be a good program. I think it came from the
AMSAT ftp, but I could have got it from the ARRL ftp sit..or to tell the
truth I was out netting and went all over the worl tracking down ham. I
was trying to find a German ftp site with the rumured new version of
JVFAX 8.0.
I am into NOAA WX sats and do not really know much about ham digital
formats. I suspect it is fairly high speed PSK. My MFJ1278 only does
AX25 1200buad, RTTY and AMTOR. You might post to the REC.RADIO.DIGITAL.
MISC. Those guys are into all sorts of digital stuff.
I hope some of this helps.

I use a program called Notify! to take my e-mail messages, paginate them, and send out through an alphanumeric paging company. I put in an SMTP gateway between the Internet and Microsoft Mail. When you send a message to my other address, it ends up on my pager.

I know there are now global alphapagers where the signal comes from a sattelite. This COULD be a viable solution to your problem.

~~~~~~

Dave, it is my understanding that the orbit being eliptical and having redundent birds (I believe there were
three), another bird is in the beamwidth of your dish before you lose signal from the first. The other problems
agree with my what I have read.

Keplerian bulletins are transmitted twice weekly from W1AW.
The next scheduled transmission of these data will be Tuesday,
August 29, 1995, at 2230z on Baudot and AMTOR.

This is possible over HF radio but I do not know how well it would work using
satellites. Amateur radio messages must be non-commercial and he may have
problems with third party messages but that would depend on where he is and
where he is licensed. If you would like some info on how to send Internet
e-mail over ham radio let me know and I will e-mail it to you.

1811. NORAD Two-Line Orbital Element Sets (TLE664)

Newsgroup: rec.radio.amateur.space
Date: 1995-08-26 00:00:00 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.809402877@dolphin>
Source record: 24313

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (334) 409-9280, and are updated daily (when possible). Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at speeds up to 28,800 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily) and some documentation and software are available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space.news and rec.radio.amateur.space. This week's elements are provided below.

```

Check this out - QSL cards!

With your own custom graphics, and text...

only $5.95 for 50!...

Custom design your cards with up to 80 Characters of text, and Your
own scanned
graphic / or antenna graphic.

Just fill out the following form, and send with total (check or money
order) to:
Shaun Qualheim, KB8RJY

QSL cards

Dept. BBS

224 Cherry Creek Road

Marquette, MI 49855

(Print, and cut here:)

Order Form: QSL Cards

Front Text:

(up to 80 characters on front) - back will have standard QSL reply
fields.
Is a graphic/photo to be scanned included? (yes/no) ____

Do you wish to have the antenna included on your qsl card instead?
(yes/no) ____
Number of sets: (50 in a set, $5.95 a set) ____ times $5.95 = ____

Plus Shipping and handling: ($1.50 per set) ____ times $5.95 = ____

Plus Scanning fee ($1.00) ____

TOTAL (sets + s & h + scan fee)
=____

(cut here)

Thank You

1813. Digitalker chip of UoSAT Series

Newsgroup: rec.radio.amateur.space
Date: 1995-08-27 00:00:00 UTC
From: yokoyama@tkl.iis.u-tokyo.ac.jp
Message-ID: <YOKOYAMA.95Aug27143303@akasaka.tkl.iis.u-tokyo.ac.jp>
Source record: 24221

Hello.

I am searching for Spec. of Digitalker Chip that UoSAT-9,11 equips.
Can I get the chip from device shop still now? or Does anyone knows
more advanced Speech Synthesis System (Chip) for generating number
or some kind of word?

yama.

From: Ben@mn.interact.net (Ben Huset)
Subject: Molniya over the pole?

In article <DDs0o7.Ayz@emr1.emr.ca>, stephens@ngis.geod.emr.ca (Dave Stephenson) says:

Russian television via Molniya (Lighting) C-band satellites is SEMI-HARD.

problem 1) Non geosync orbit requiring active tracking with ALT/AZI pointing.
Note a fairly cheap computer can do this ie) Apple][, although
I have heard stories of people MANUALLY re-pointing their dish
every 15-30 mins.

Problem 2) Need a fairly big dish, 10' minimum, 16-32' preferred.

Problem 3) SECAM TV format. can be displayed on multiformat monitors.

Problem 4) Audio not above video but mixed into horiz blanking area.
Note: This has been fixed by them adding 2nd audio signal
above video signal to be more compatable with cheaper
western TVRO RX gear.

Problem 5) Language in Russian. Although the pictures are nice. Its weird
seeing Fraggle Rock dubbed in Russian but they SING in english.

Problem 6) Ocassionally one or more of the Four satellites in the constillation
is 'on the blink'.

Several colleges have a setup to receive this for their Russian Studies.
if you see a dish NOT pointed to the SW, SE or S but to the NE then they have
such a setup. U of IA and Crighton in Omaha come to mind.

There are a few firms out there that will sell you a turnkey system installed for
about $50,000-$100,000.

If you live EAST of the Missippi or better yet east of the OHIO river vallely
you can pick up the signal from their Geo-sync birds.

Hope this helps.

Does anyone access domestic Russian television from Molniya satellites,
over the north pole? How difficult is it to do it? Can I use surplus
C-band equipment?
If you know of a good written description of how to do this little stunt,
I'd really like to know the title of the publication reference.

~~~~~~
~~~~~~~~~~~~~~~~~~~~~~~

Dave, it is my understanding that the orbit being eliptical and having redundent birds
(I believe there were
three), another bird is in the beamwidth of your dish before you lose signal from the
first. The other problems
agree with my what I have read.

If you can afford it, Instant Track is propably the best tracking
program. Do a net search for amsat. I think you have to order it
via the phone with a credit card. Several of the sat gurus around here
use it. At the Amsat.ftp archive they have several different freeware/
shareware trackers. I know that IT supports computer control of your
rotor. I use PREDICT.EXE, it is a freeware text only tracker, schedular.
You can get the orbital elements for the airforce ftp. Since I switched
to netscape I can not quickly find net addresses. Do a net search.
Yesterday I downloaded a new(for me) tracker. STSORBIT. It appears
(from reading the docs) to be a good program. I think it came from the
AMSAT ftp, but I could have got it from the ARRL ftp sit..or to tell the
truth I was out netting and went all over the worl tracking down ham. I
was trying to find a German ftp site with the rumured new version of
JVFAX 8.0.
I am into NOAA WX sats and do not really know much about ham digital
formats. I suspect it is fairly high speed PSK. My MFJ1278 only does
AX25 1200buad, RTTY and AMTOR. You might post to the REC.RADIO.DIGITAL.
MISC. Those guys are into all sorts of digital stuff.
I hope some of this helps.

Clean or replace the dirty position indicating pot.

Gary

Kit, Hamtronics (not good, oscillator has spurs, and NF is poor,
overloads when used with a preamp, cheap, but you
supply case. Not recomended.)

Used, Microwave Modules (out of production, needs to be fronted with
a GASFET preamp, mast mounting possible)

New, SSB Electronics (good but expensive (abt $200), GASFET front end
included, mast mountable. *The* one to buy if
you go commercial.)

Homebrew, ARRL Handbook and Microwave Update or RSGB VHF/UHF book. Choose
a design with a Butler oscillator and a diode ring mixer. Front
with a GASFET preamp.

Alternative, a Down East Microwave transverter fronted by a mast mounted
GASFET preamp. This costs little more than a good converter,
and gives transmit capability too. Basic kit $155, amp and
W/T extra.

ARR used to offer a mast mount converter with GASFET, but I don't know if
it's still available (was abt $170). Good NF, but prone to lightning and
static damage.

A note on kits and homebrew, you need good test equipment to align and
tune up these things. You *can* get by with just a weak signal source
and a counter, but that isn't recomended. In particular, the Hamtronics
kit can *appear* to be operating properly, but be spurious as all hell.
Checking the LO with a spectrum analyzer immediately pinpoints the problem.

Hello All.
Can anybody help me with any info on the SARA Satelitte. The info I would like if possible is, 1. Is the sat still active, 2.What are the down link frequencies, 3. What Data mode is used ie AX25 or other, 4. Is there any decoding s/ware available for the Data.
If anybody can help please send any info to:- rs93463@midet.com or post to this conference, Thanks All.
73 Steve RS93463.

The multiple-bird Molniya orbit does let you get away with pointing your
antenna in a fixed direction, but it works best from directly underneath
the apogee of the orbit. Over on the other side of the world, the angles
aren't as favorable.

How accurate is the SGP4 model for HELO earth satellites. I have been playing with source code from SatTrack, SEESAT and a few others and it appears (?) to be accurate. Any feedback would be greatly appreciated.

William,
You might try corresponding with Dr. T.S. Kelso at the Air Force Institute of Technology (AFIT). He is the author of several satellite tracking packages and produces most of the two line element data seen on the internet. His email address is tkelso@afit.af.mil.

Sounds like a dirty azimuth potentiometer inside the rotator.
The analog meter circuit may have some averaging or damping
feature (capacitor) so that it doesn't pick up the spikes??

I haven't done this yet, but the problem has been well described on AMSAT-BB and also on the digital satellites. You need to setup the KCT/T under "old Windows". It will then run fine under WIN95, but in order to edit the setup file in WIN95, you'll have to manually edit the KCT/T.INI file (not it's correct name, but the appropriate "INI" file).

Chris Jackson is working on the driver for the KCT/T so that you can alter it in the usual way under WIN95. It'll probably be a month or so. Try setting it up on a computer under "old Windows" then copy the appropriate "INI" file to your WIN95. That should work fine for now.

Try Down East Microwave. I don't think that they have one that goes
directly from 440 to 28 but they will have ones that go from 144 to
28 and from 440 to 144. They have them all the way up to 10GHz.
They have a pretty good assortment of linear amps for 440 and
144 too. Sorry I don't have the address or phone number but they
are usually in QST, CQ and 73 mags.

William,

the SatTrack (V3.1) implementation of the SGP4 model has a typical precision of better than 10 minutes of arc in azimuth and elevation angles for typical orbit predictions with two-line element sets that are not more than a few days old. The calculations of the latitude and longitude of the sub-satellite point are even more precise. A lot depends on how old your two-line element sets are.

For more details check the SatTrack web page at:

http://ssl.berkeley.edu/isi_www/sattrack.html

DEM is at 908-996-3584, in Frenchtown, NJ. At home, as I type, a partially assembled DEM 432-28mhz transverter sits on my bench. This is the design that is intended as an IF transverter for use behind a 10.368Ghz transverter. It is a nice, but bare bones kit, with separate Rx/Tx ports for both the 28mhz IF and the 432 side, and about a 4db NF, as I recall. (Remember this is an IF transverter) It sold for $109. When I have it up and running, my intent is to pick up the 10G modular transverter system. Steve also sells a high performance kit, with options available for switching, power, and packaging. I don't have the specs handy, but give him a call if you're interested.

Well,

I guess, I can start the next political question.

Does anyone have a recommendation for pre-amps for a satellite station
I have the KLM 2m/440 full length crossed yagis and was wondering what about
preamps.

If you have a preference, please post or email.

Thanks,
Alan Adamson

1834. TM-742A

Newsgroup: rec.radio.amateur.space
Date: 1995-08-30 00:00:00 UTC
From: rick.edwards@mogur.com
Message-ID: <950830093044445@mogur.com>
Source record: 24242

I have a new 742A. It is a great radio! I enjoy it very much.
However, I do have a couple of questions that I can't seem to find the
answer to in the manual. Maybe you can help me.

1) When using the autodialer, the button sequence is PTT, PF, & then the
autodialer memory number (#1 in my case). The transmitter turns on when
the PTT is pressed, of course, but then turns off when the PF button is
pressed and then back on for the DTMF string. However, there is no (or
very little) pause between the transmitter turn on and the sending out
of DTMF. I use two repeater autopatches and neither of them likes this
and it _usually_ results in a misdial. Question: Is there anyway to
add a pause or a brief wait between the transmitter turning back on and
the output of DTMF?

2) When using the 742A in a crossband repeat mode between a 220
repeater and my 2m HT, I have to wait for the 220 repeater to drop
before I can transmit. This becomes a real drag when on a roundtable
on the 220 repeater and it has a long hang time. Is there anyway
around this? Is there a way to make the 742A act like a single
frequency repeater on the 2m side (ie. sample the receive every few
hundred milliseconds)?

Thanks....<re>

I would give them consideration for use with the 1200 baud birds. If
you lived in a part of the world with low amateur density, they would
be fairly suitable on the 9600 birds. The competition over North
America and Europe is very high, with many high powered stations using
AZ/EL setups. Your Eggbeater setup just doesn't quite make it.
You definately need a good quality pre-amp for the downlink. I would
recommend that you order the ground-plane kit for each as well.

I switched to the M2 Oscar antennas with the Yaesu G5400B AZ/EL setup
and the Landwehr pre-amps. The antennas are controlled with the
KCTracker.

Good luck.

1843. Help with DO-17

Newsgroup: rec.radio.amateur.space
Date: 1995-08-31 00:00:00 UTC
From: kory@avatar.com
Message-ID: <4250r6$drk@avatar.avatar.com>
Source record: 24251

Hi everyone,

I been trying pickup the DO-17 downlink with little success. I can clearly hear it on the speaker, althought most of the time its not full quieting. Here's my setup:

- Yaesu FT-736R
- Diamond 510 omni ground plane
- TE Sestems 1412G amp & pre-amp
- AEA PK232

I have the TNC monitor more set to 4 (and I tried six) and its in packet mode. When I disconnect the TNC from audio out, I can clearly hear DO-17`s telemetry downlink, but most of the time its not full quieting.

Is there any special mode or option I need to set on the TNC? This configuration works great for regular terestrial packet. Also, for normal packet usage, do you squelch your radio and then adjust it so it unsquelchs when it starts reciving packets or do you futz around with the volume/treshold levels? The AEA manual sucks and wasn't very clear on how to calibrate everything.

Any help would be greatly appreciated.

Thanks,
Kory

Kory,
I think some of your problem may be obsticals in the way of the
antenna. Also remember the doppler effect. At the start of a pass I'm on
145.830, when at it's highest 145.825 and when it's past it's highest
145.820. Set your tnc as you do for normal packet work. I know where I
live what I recieve all depends on what's in the way. I.E. mountains,
buildings, trees. Don't neglect the low passes unless you know mountains
or something else will block it's signal. I set up my tnc as usual, Plug
in the radio cable - turn DOWN squelch and volume, then turn up volume
til the recieve just lights up then turn up squelch until recieve light
goes out. That should do it for you.

Tom - KB2SMS

1845. OSCAR 10 Advice Sought

Newsgroup: rec.radio.amateur.space
Date: 1995-09-01 00:00:00 UTC
From: leigh@rain.org
Message-ID: <425s4n$qq7@news.rain.org>
Source record: 24253

I'd like suggestions on working OSCAR 10 with extremely minimal gear. Thus far I'm using a small 2 meter beam and an older Icom 260 for recieving, and I can hear most SSB and nearly all CW signals.

My uplink gear consists of an Icom 3-watt 402 435 mhz SSB/CW rig, and a 19 element 432 beam. With just moving my balcony-mounted antennas by hand, I can sometimes weakly hear my CW on the downlink.

Yes, I'm planning on buying a 432 amp in the 50 to 100 watt range. For tracking I'm using TRAKSAT/version 2.80.

Question: when using minimal gear, what sections of a typical pass are the easiest to work? (I suppose the closer passes, but what else?)

Thanks and 73. --Leigh/KM6JE.

This may be an odd question, but has anyone tried running the KCT Tracker/Tuner and associated software under Windows 95 yet? Please email me to the following address. Thank you!

"We, the people are the rightful masters of both the congress and the courts - not to overthrow the constitition, but to overthrow men who pervert the constitution" - A. Lincoln

1852. NORAD Two-Line Orbital Element Sets (TLE668)

Newsgroup: rec.radio.amateur.space
Date: 1995-09-01 00:00:00 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.809999766@dolphin>
Source record: 24260

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (334) 409-9280, and are updated daily (when possible). Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at speeds up to 28,800 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily) and some documentation and software are available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space.news and rec.radio.amateur.space. This week's elements are provided below.

```

Kory Hamzeh (kory@avatar.com) wrote:

: Hi everyone,

: I been trying pickup the DO-17 downlink with little success. I can clearly
: hear it on the speaker, althought most of the time its not full quieting.
: Here's my setup:

: - Yaesu FT-736R
: - Diamond 510 omni ground plane
: - TE Sestems 1412G amp & pre-amp
: - AEA PK232

: I have the TNC monitor more set to 4 (and I tried six) and its in packet
: mode. When I disconnect the TNC from audio out, I can clearly hear DO-17`s
: telemetry downlink, but most of the time its not full quieting.

: Is there any special mode or option I need to set on the TNC? This
: configuration works great for regular terestrial packet. Also, for
: normal packet usage, do you squelch your radio and then adjust it so it
: unsquelchs when it starts reciving packets or do you futz around with the
: volume/treshold levels? The AEA manual sucks and wasn't very clear on
: how to calibrate everything.

: Any help would be greatly appreciated.

: Thanks,
: Kory
: KE6VWO

Be sure 'Monitor' is set ON, and you are in command mode (not transparent)
mode), to receive as ASCII. I use KISS mode.

Hey,

My dad (WADYD) is doing the same thing. I think he is building a turnstile type antenna which is circularly polarized and fits in the attic! It's simple AND cheap!

I believe if you look in the 1981 or 1982 ARRL Amateur Radio Handbook you will find the design for it. If you don't have access to it I can mail it to you... just send me some mail back with your address.

Later,

1856. Home-building antennas for 137.xxx APT birds...

Newsgroup: rec.radio.amateur.space
Date: 1995-09-01 00:00:00 UTC
From: rdemar@mail.msen.com
Message-ID: <426563$413@pravda.aa.msen.com>
Source record: 24264

Hello all,

I have been a low-sat weather imaging hobbyist for some time now and have managed some nice images on a nearly nonexistent budget from the start. I am using a Uniden 100XLT (modified), a TV preamp, a 7 foot marconi type antenna, and DRIG's SBDSP software. Sounds crappy, yes, but it works well.

I want to build a better antenna for this that I could possibly fit into the attic of my apartment. I have heard that the polar orbiters use a "Circularity Polarization" antenna system. Does anyone know anything about this and how I can hand make a reasonably efficient antenna for it? Any help is greatly appreciated!

1857. ?? What Radio to Buy ??

Newsgroup: rec.radio.amateur.space
Date: 1995-09-02 00:00:00 UTC
From: dpmoore@rain.org
Message-ID: <428jmc$uu@news.rain.org>
Source record: 24165

I could use some advice on which radio is best for satellite (voice & packet)

I would like to get one of the new rigs like the IC-820H but haven't heard anything good about it. Then there's the Yaesu FT-736R and Kenwood TS-790A, both of these have been around awhile. Which radio is best, or should I just wait for someone to come out with something new?
If anyone has any practical advice regarding satellite rigs pleas send E-Mail to me at:
dpmoore@rain.org

-Dan WD6CYI

1858. Re: faq/MIR info

Hello David,

You can heard Mir on 145.200, 145.550, or 145.800 MHz. Most of the time it is packet transmissions. But at times, you'll hear voice from the crew. A new crew is scheduled to be launched on Sept 3 and they will be taking a German up with them. His call will be DP0MIR. Hope this helps. If you need anymore help, feel free to ask.

Keith

Wasnt there an article in QST magazine about a year ago dealing
with someone who did this? Hmmm.... Maybe it was the comet that
hit Jupiter (I think)... It may be worth checking out...

1861. UHF SSB/2M MAST MOUNT PREAMP FOR SALE

Newsgroup: rec.radio.amateur.space
Date: 1995-09-02 00:00:00 UTC
From: lamb@execpc.com
Message-ID: <429r85$168@homer.alpha.net>
Source record: 24169

I have a Yaesu ft790R MKII UFH SSB/CW/FM 430-450 MHZ 25 Watts out transceiver used for satellite work for sale at $450...includes options.

Also, a Mirage KP2/2M mast mount 2 meter preamp at $100 also used for satellite work.

If interested, contact me at lamb@execpc.com

Everythging works, transceiver is in very good shape in original box, etc. Mastmount preamp works well, but doesn't look as nice since it has been out on the
mast for a year. I am original owner. Getting out of satellite hamming.

Greg

: >
: >Are there any higher speed amateur digital satellites being planned?
: >(19.2k baud or faster) Adding 56k+ baud cability would greatly
: >enhance performance on low orbit satelites. It would allow modes like
: >digital voice and crosslinking of multiple satellites.

: I am in favor of higher speeds as well. The load on the present 9600 bps sats
: is maxed out when they are over populated areas. The biggest problem is in
: getting enough power to put out a readable signal from the satellite. The
: size of the sats are very limited, and there is only so much area for solar
: panels. There are some modulation schemes that conserve power, but the cost
: of the modems and special RF gear is pretty extreme.

: >I've heard rumors
: >that phase IIID might offer T1 speeds? That sounds great.

: Actually, user links will probably be at 9600 bps. These will link to
: groundstations through the satellite at high speed (64k) and allow for some
: really BIG storage availability.

: >But it's unwise to have all our faster digital hopes based on one one
: >satelite with no backup. We should also be building relitivly cheap
: >high speed digital satellites in low to medium orbits.
: >Anyways I do hope the designers of phase IIID are planning for the
: >future and implement 1.5 Mbps channels. This would allow for some
: >very powerfull capibilities in amateur radio.

: It would be nice, but the expense to a ground station to be able to receive
: at that speed would be very large. There's a lot more to it than just a
: $300.00 modem. 64k is starting to come down in price, and will much more now
: that ISDN is (finally) coming around. For now, I think it best we take it one
: step at a time and try for the 64k and get that tested and affordable. Then,
: lets move up some.

I'm a bit surprised that amateurs have not jumped onto the 56k bandwagon at
a greater pace... granted... as mentioned above, the equipment is still not
cheap, BUT I was reading the GRAPES WWW page and the modem has been redesiged
with costs, etc in mind... I guess time will tell. I'm not up on all the
sat stuff lately, but from what was said above I am a bit surprised that
there has not been serious talk of trying to fly 56k packet. Is it my
imagination or is progress slowing down as time goes on? Maybe I'm just
getting older and it seems that way...hihi.

1864. Ham Radio Test Simulators - Macintosh

Newsgroup: rec.radio.amateur.space
Date: 1995-09-03 00:00:00 UTC
From: john@wd1v.mv.com
Message-ID: <john-0309950822470001@wd1v.mv.com>
Source record: 24172

FREE - NEW Macintosh HAM TEST SIMULATORS

Studying for a ham test and have access to an Mac?

Upgrade Fast! Simulate the test and get S T I M U L A T E D!

Scores of 90% or > even get applause!

The new Macintosh Ham Test Simulators are HERE (and there if you can FTP)!

o Novice Ham Test 5.0 SA.sea
o Technician Ham Test 5.0 SA.sea
o General Ham Test 5.0 SA.sea
o Advanced Ham Test 5.1 SA.sea
o Extra Ham Test 5.0 SA.sea

The latest version "5" feature:

HyperCard 2.3 as a stand-alone application (SA) eliminating
your need to have HyperCard. All you need is a Mac with 4
Meg of memory and version System 7 or greater.

Each version "5" Ham Test Simulator has the latest questions
as prepared by the Question Pool Committee.

Each version "5" Ham Test Simulator is FREE OF CHARGE and work the
same way as the originals did (written by Diana, KC1SP).

You may obtain a version "5" Ham Test Simulator by mailing me a *FORMATTED
disk (1 per test) and include a Self Addressed and Stamped disk mailer for
the return.

Each version "5" Ham Test Simulator is also bundled with a shareware CW
program called MacMorse 1.4 written by Doug, WB0EON.

Also included in the version "5" collection are text files that relate an
interesting variety of ideas about the best way to study CW and prepare
for tests.

Or warm your phone line and get JUST the tests:

America On Line - Macintosh Ham Radio Section

or:

ftp://oak.oakland.edu//pub3/hamradio/mac/theory-and-morse/AdvancedHamTest.sea.bin
(Aug 30th)

1865. Meteors by radio: the FAQs

Newsgroup: rec.radio.amateur.space
Date: 1995-09-03 00:00:00 UTC
From: steyaert@vvs.innet.be
Message-ID: <steyaert.6.000CAF95@vvs.innet.be>
Source record: 24173

Meteors by radio: the FAQs

METEOR SCATTER - the FAQs Rev. 2, Sep 3, 1995.

0. About these FAQs

These FAQs are the result of your various questions and remarks to the monthly RMOB (Radio Meteor Observation Bulletin), and discussions in the Radio Astronomy Forum of Compuserve.
Constantly amateur astronomers, radio amateurs and schools looking for new projects, get involved in observing meteors by radio methods, and need the same basic information.

0.1. Revision / posting frequency

As promised in Rev. 1, the references have been updated.
Several persons have been observing meteors by radio for the first at the occasion during the Perseids 1995. Accordingly, the practical sections how to build a meteor station and to recognize meteor reflections have been expanded.

Rev. 3 is due in November 1995.

0.2. Distribution

These FAQs are posted on:
sci.astro.amateur
rec.radio.amateur.space
uk.radio.amateur
Compuserve's Astronomy Forum, Section 11, Radio Astronomy.

Please let me know if you feel that other newsgroup are interesting too or more appropriate.

These FAQs are also e-mailed to the RMOB subscribers (see further).

0.3. Acknowledgement

Many thanks to Tom Ashcraft (72632.1427@compuserve.com) and other participants to Compuserve's Astronomy Forum for the stimulating discussions. Jeroen Van Wassenhove (100101.734@compuserve.com) compiled the larger part of the references, and made other useful comments.

1. What is meteor scatter (MS) ?

Meteor scatter is a form of electromagnetic wave propagation. The ionized trail of meteors (typically appearing between 100 km and 80 km high) acts temporarily as a reflector for radio waves.
A meteor does NOT generate detectable radio emission itself!

In the case of forward scatter, the transmitter and receiver are at different locations. Backscatter can be seen as a special case, whereby the sender and receiver coincide (typically the case of radar).

Meteor scatter can be used day and night, allowing daylight meteors streams to be studied.
Meteor scatter can also be used for secure communication.

Historically, meteor streams were conclusively detected by means of radar at the end of World War II.

2. How to observe MS ?

Tune to an "empty" frequency in the VHF band, and wait until a suitable oriented meteor trail reflects a distant broadcasting station. You hear a more or less short (a fraction of a second to tens of seconds) fragment of the remote broadcast. Occasionally, more than one station (together or one after the other) can be heard. Routinely, stations of 300 km to 1000 km away can be observed. The problem however in densely populated areas can be to find a non-locally used frequency.

2.1. Which frequencies to use ?

The lower the frequency, the better... but at too low frequencies, the radio- waves bend and follow the curvature of the Earth.
A lower practical limit is 40 MHz. More commonly, the VHF is suitable.
VHF Band I ranges from 41 to 68 MHz, and is used for TV.
The FM band (88 MHz - 108 MHz) is also used frequently. Try as low as possible in the band, and avoid free radio's in the upper band (104-108 MHz).
Not to forget are beacons at e.g. 50 MHz or 75 MHz.
Radio hams listen also to MS in the 2 m (144 MHz) band. The reflections are shorter and weaker than at the lower frequencies. Radio amateurs worldwide have standard procedures for using meteor scatter. They listen or transmit during well defined periods to well defined areas. For more information, please contact Bob Bruninga, WB4APR @ KA3RFE.MD (bruninga@greatlakes.nadn.navy.mil).
There is little use in trying MS at still higher frequencies.

2.2. Which equipment to use ?

A regular FM receiver is sufficient. An all-band receiver is of course better in terms of sensitivity and features such as bandwidth selection. Connect a horizontally polarized Yagi antenna with 4 to 6 elements (not too directive) to your receiver. The antenna can be pointed horizontally, or at a certain angle (the latter avoids direct reception from nearby stations). Keep the antenna feed cable short to minimize losses, or add an antenna amplifier.
With a good setup, it should be easy to obtain 10 to 20 meteor reflections per hour when no stream is active (the sporadic background). During streams, this number can get as high as several hundreds.
Due to the daily variation in meteor activity, more reflections are received during the morning hours (5h to 6h local time) than in the evening (18h). This can serve as a proof that you are actually observing meteors!

2.3. Always possible to observe ?

Unfortunately, other forms of propagation interfere with MS.
The worst one is sporadic-E or Es, consisting of conduction clouds in the high atmosphere that make permanent reception of remote stations possible during minutes to tens of minutes. The sporadic-E season is from May to July in large parts of the northern hemisphere. In some regions however, sporadic-E is unknown!

There are also tropospheric influences. A temperature inversion can also cause reception over wider ranges than normal.

Thunderstorms cause very sharp peaks. On FM, most of these (amplitude modulated) spikes are suppressed. However, DO NOT connect your antenna to your receiver during thunderstorms or when you are absent for longer time. Lightning strikes have ruined several radio shacks.

2.4. One step further: recording meteor reflections

Meteor reflections can easily be recognized by listening. But a better measure of the shape of the reflection can be obtained in accessing the signal strength and recording it, either on a pen recorder, either feeding it into a computer via an analog/digital (A/D) convertor. Special care has to be taken to shield well the computer, power supplies, add filters etc., or the computer signal will be more or less noticed in the receiver. Optocouplers can be used to separate the grounds. However, some sensitivity and linearity will be lost in using them.
Alternatively, the game port input of a PC can be used too. The sampling rate is lower (say 20 samples per second), but this is often good enough.

Meteor reflections can broadly be divided in two classes - underdense and overdense - with different reflection profiles. These profiles can be related to the physical characteristics of the meteors.

3. Who else is observing ?

During recent years, amateurs in following countries have been recording meteor reflections: Austria, Belgium, Denmark, Germany, Finland, Japan, the Netherlands, Portugal, the UK, the USA.

Some of them observe only during the periods of the great streams, others run continuous automated stations.

Only a few radars are still used for monitoring streams. One is run by O. Belkovitch (oleg@astro.kazan.su), at Kazan University.
K. Suzuki, Aichi, Japan operates the MU radar wave of Kyoto University (46.5 MHz, 1 MW) at Toyokawa Meteor Observatory in Aichi, Japan.

4. How to relate radio- to visual observations ?

Hearing and seeing a meteor is a unique experience. There is a fairly simple relation between the visual magnitude of a meteor and the duration of the reflection. At 70 MHz, a zero magnitude meteor gives typically rise to a 1 second reflection. (At higher frequencies, the duration is

shorter).

5. How to correct MS counts to standard conditions ?

The number of meteor reflections that will be observed from a certain stream is not a simple function of radiant height, as is the case with visual counts (cfr. the zenithal hourly rate).
Conversely, deriving the true number of meteors from the observed number of meteors is not a trivial matter, certainly not when more than one transmitter is involved. Certainly, a stream does not necessarily peak when the observed number of meteors is highest!

The various parameters, such as antenna characteristics, position of transmitter and receiver, radiant position and other stream characteristics, power of the transmitter etc. can be fed into a simulation program, such as FORWARD (by the undersigned). Although the general activity pattern can be reconstructed, one has to be careful.

For visual meteors, the observed number is highest when the radiant is in the zenith (all other remaining the same). This is not so for the number of meteor reflections: the maximum number is observed for a radiant elevation of 45 to 50 degr. When the radiant is too high (say more than 80 degr), very few reflections are received!

6. Where to find meteor stream data ?

The International Meteor Organization (IMO), specializing in visual meteor observations, issues a yearly meteor stream calendar, which can be found on several places on the Net and on Compuserve. Contact otherwise Juergen Rendtel (jrendtel@aip.de) or Peter Brown (peter@canlon.physics.uwo.ca).

Gary Kronk's home page [http://wums.wustl.edu/~kronk/index.html] gives also a good overview of the various streams.

7. Where to find observational data and reduction software ?

Ilkka Yrjola, OH51Y (ILKKA.YRJOLA@915000.KY.KYMMENE.MEMONET.mailnet.fi) makes his data available on ftp server FTP.FUNET.FI in directory pub/ham/vhf-work/mssoft42.zip. The software for viewing is available too, as well as stream data.

The author edits the monthly RMOB, which gives summaries of recent observations from all over the world. Included are the setup characteristics. Contact me for putting you on the distribution list.

8. References

8.1. Books

THE reference is still "Meteor Science and Engineering" by D.W.R. McKinley, McGrawHill 1961. A fantastic book, giving the theory and practical results of the heydays of the radio meteor science.

A recent, less astronomical and more communication oriented work is:
Meteor Burst Communications (Theory and Practice) Ed. Donald L. Schilling,

Wiley Series in Communications, 1993, ISBN 0-471-52212-0.
reference section.

A very concise, but technical, introduction to the subject is:
Schanker, Jacob Z., "Meteor Burst Communications", Artech House, Norwood, MA, 1990 ISBN 0-89006-444-X

Another classical work is "Meteor Astronomy, Lovell, A.C.B., University Press, Oxford, New York, 1954."

With their project write-up, "Automatic Registration of Meteors, University of Ghent, 1991.", B. Callens and P. Vauterin won an international science price. A thesis (in Dutch) built further onto this: " De automatische waarneming van meteoren door middel van radioreflecties op 66MHz., Van Bavinckhove, C., University of Ghent, 1994". It gives interesting results obtained with a dual setup in order to eliminate interference.

8.2. Periodicals

The regular astronomy magazines, such as Sky & Telescope, Astronomy, or Astronomy Now run occasionally contributions about forward scatter experiments.

WGN, the Journal of IMO, contains sometimes contributions and letters about radio observations of meteors.

>Thanks...
>
> Mike
>
According to the military studies, 30-50 MHz is the optimal frequencies for
meteor communication. There are lots of pagers and other non-voice services down
there. These are likely to be on 24 hours also.
Up a little higher, the FM broadcast band is a 24 hour service with high power
to boot.
You should be able to hear many pings on a daily basis in the low VHF band.

1868. KCT and ICOM 820H

Newsgroup: rec.radio.amateur.space
Date: 1995-09-03 00:00:00 UTC
From: headshrnkr@aol.com
Message-ID: <42cgcn$lfk@newsbf02.news.aol.com>
Source record: 24176

Hello.

I am in the process of installing a Kansas City Tuner/Tracker board into my system. So far I have the tracker function running without a problem, works pretty slick too! I do have a problem connecting the Tuner function to my ICOM 820H. Taking the advise of the manual I did not use the ICOM CIV interface. I chose instead to run the radio at TTL levels direct from the KCT board. I can not seem to get the radio to change frequency.

If I use the TEST function supplied with the KCT software I can switch the radios mode, but not alter its frequency. Also I can not get the TEST function to reconize the radios address. I have the baud rate set at 1200 and the interface set to 66 as advised. What am I missing here? Do I need to create a file to "define" the radio for the Tuner software? Any assistance would be greatly appericated!

Source record: 24177

Hi All,

My question is... does it matter?!

Certainly for 2mx it doesn't... I'd suggest saving your $ for the 70cm preamp...
At my station I use a homebrew 'fet' (not gaAs fet) preamp 'at the rig' which provides more than enough performance (this unit was tuned on air monitoring the AO-13 beacon!!). The 2mx antenna is a 20 element X-yagi.

For 70cm however, the story changes significantly...
Here, I use a commercial Mirage 70cm gaAs fet preamp. (There are probably better
quality units about but...) I use it mainly for 'low pass' digital spacecraft passes, just to get that few extra minutes connect time! Again, its mounted in the shack... yes I know, it would never do for 'moon bounce' but...

I guess, what I'm suggesting is, don't go to too much bother for 2mx satellite! Just about anything will do, just to lift the signal above the noise floor. Certainly don't bother putting it up the mast!! you won't be able to tell the difference!!!

70cm is another story... it will depend what you will mainly be using it for. Here, a mast mount preamp is most desirable and it may pay to invest in a good quality unit. I don't have the test eqipment available to me now days, so I opt for a commercial unit!

I think that is important to know when to 'build or buy'! Thats the difference between success and wasting money!

happy hammin' Ted VK1BL.

1870. PK TNC's help needed #2

FROM: Bernie, KF0QS

I have been quite pleased with my Yaesu FT-736R. I use it with a
marginal antenna setup (omnidirectional M Squared Eggbeaters on both
two and 70 cm, preamp on 70 cm, and a brick amp on two, about a 50 foot
run to the antennas with 9913 cable), and can access all the LEO's,
except that I haven't tried the 9600 baud birds yet (and have been
warned that I'd need an az/el setup). The 736 is quite versatile and,
though the QST review says it is quite complex to learn, I have done OK
with it (and I am no technical wizard). It does seem a bit delicate
(once, relatively mild static discharge when I was plugging in an
external keyer knocked out the cw keying function). It does have space
for two more band modules, and I understand the Kenwood only has space
for one more. The QST review is in the May 1990 QST at page 30.
Good luck. 73's de Bernie, KF0QS.

1875. Phase IIID Downlink Parms?

Newsgroup: rec.radio.amateur.space

Can anyone tell me where to get comprehensive information on the pre-flight predicted transponder parameters for IIID online? I want to run some link budgets.

Also... what new mode on IIID will be most popular? Someplace to start the link calcs.

>Kory
>KE6VWO

Hi Kory! I have a YAESU FT-736R, an AEA DSP-1232, and M2 VHF and UHF antennas. I track DO-17, set my TNC for terrestial reception, i.e., 1200 FSK or modem 12 on my TNC, and data should come out on the screen. For DO-17 tracking is not necessary as I heard the digitized voice once on a handheld with a rubber duck. In short, all TNC and radio parameters can be set for terrestial use. Good luck! 73 de KC7EMC

1877. A PG Question

Newsgroup: rec.radio.amateur.space
Date: 1995-09-04 00:00:00 UTC
From: tgliang@eskimo.com
Message-ID: <DEEnEn.AwC@eskimo.com>
Source record: 24185

I recently had PG and PB running, and I had three acknowledgments of a message I uploaded to KO-23 sent to me. In the process to setting up PG, I turned on the "debug" option on the configuration file for PG. Now even if I took it out of the config file, it still gives an 8-column hex and ascii diagnostic. Is there a way of turning it off? Or, maybe something else is causing it. Any comments will be appreciated. 73 de KC7EMC

1879. FASat-ALFA, THE FIRST CHILEAN SATELLITE

Newsgroup: rec.radio.amateur.space
Date: 1995-09-04 00:00:00 UTC
From: root@asarginv.ORG.AR
Message-ID: <Pine.LNX.3.91.950904164551.3513A-100000@asarginv.org.ar>
Source record: 24187

FASat-ALFA, THE FIRST CHILEAN SATELLITE

INTRODUCTION.

FASat-Alfa will be the first Chilean satellite, and is being constructed under a Technology Transfer Program between the Chilean Air Force (FACH) and Surrey Satellite Technology Ltd (SSTL) of the United Kingdom. The primary goal of the Program is to obtain for Chile the scientific and technological experience required to develop a National space capability. The FASat-Alfa mission will create a group of engineers with aerospace experience who will operate the first Chilean satellite in orbit from the Mission Control Station (ECM-Santiago) in Chile.

FASat-Alfa Satellite.

The FASat-Alfa Satellite of 50 kg will use the modular UoSAT bus, proven in the previous missions. The satellite is being constructed at SSTL by a combined group of engineers from FACH and SSTL. FASat-Alfa was launched in the late August 1995 as a secondary payload into a circular orbit of 650 kilometers at 82.5 degrees inclination, on board a Tsyklon rocket made by KB Yuzhnoye of Ukranie form the Plesetsk Cosmodrome in Russia. The main payload of that launch is the Sich-1 spacecraft which is the first Ukranian satellite.

FASat-Alfa Bus System.

The FASat-Alfa is based on a bus that is integrated in a 600 mm by 350 mm by 350 mm box. The box is formed by 11 modules of heights between 26 and 50 mm. On top of these module boxes there is a structure called the Earth Observation Platform which encloses all the cameras and special sensors that need to point to the Earth.

The FASat-Alfa bus systems include a number of enhancements over previous SSTL missions. The main enhancements include the new local area network CAN, and a new On Board Computer (OBC) based on a INTEL 386EX processor.

EXPERIMENT PAYLOADS.

The experimental payloads on board FASat-Alfa will be the following:
1) Ozone Layer Monitoring Experiment (OLME).
2) Data Transfer Experiment (DTE).
3) Earth Imagine System (EIS).
4) Global Positioning System Experiment (GPS).
5) Solid State Date Recorder Experiment (SSDRE)
6) Educational Experiment (EdEx)

OLME

This experiment is very important for Chile because of the geographic location of the country within the depletion area of the Ozone Layer in the Antarctic. This experiment is based on the measurement of the ultraviolet solar backscattered radiation in frequency bands around 300 nanometers. The experiment will have two types of devices in order to measure that radiation, UV cameras, based on special CCDs, and UV photodiodes.
Measurements will be made in the Antarctic and sub-Antarctic regions of Chile, and the data collected with this experiment will be correlated with the ground based observations of the Ultraviolet Radiometric Network run by the Meteorological Directorate in Chile.

DTE Experiment.

The objective of the Data Transfer Experiment is to provide the Space Segment Infrastucture, i.e. necessary hardware, satellite interfaces, firmware and software, to allow a variety of data communications experiments and demonstration objectives to be supported. The potential experiment can be grouped into four major activities:

Uplink experiments data collection.
Duplex/Two-way experiments-data transfer(collection and distribution).
Downlink experiments data distribution.
Technology demonstration-enhanced modulation/data rates/small terminals.

The hardware for the DTE consists of two redundant receivers and a redundant Digital Signal Processing (DSP) unit based on a C31 processor. The FASat-Alfa uplink is in VHF and the Dowlink is UHF, both in the WARC92 "Litle Leo" frequency bands, and use a digital store and forward transponder. Even though FASat-Alfa is not an amateur satellite the operation is similar to UoSAT-5 and Kitsat 1 and 2.

EIS Experiment.

The Earth Imaging System on FASat-Alfa have two visible light cameras: a wide angle camera with a ground resolution of 1500 meters, and a narrow angle camera with a resolution of about 150 meters. The wide angle camera have the same field of view as the Ozone monitoring cameras. These cameras are located in the Earth Observation Platform. They provide snapshot images of the Earth, that are then stored on board the satellite for downloading at a later time.

GPS System.

The function of the GPS receiver is to determine the position of the satellite in space and use this information for on-board generation of Keplerian elements, using the 32 bit transputer system.

Solid State Data Recorder Experiment.

This system provides 2 GigaBits (256 Megabytes) of solid state storage memory based on new RAM technology. Each system of FASat-Alfa have access to this memory through the CAN local area network. Main users are the OLME and EIS payloads; the SSDRE will store more than 600 images of 300 KiloBytes each. This experiment is in collaboration with Sanders, a Lockheed Martin

company from the United States.

Educational Experiment.

This experiment is directed to Chilean youth, the idea is to generate a special mood about space with a satellite that they could feel more close to themselves. The EdEx uses the DTE experiment through digital processing in the DSP unit, in order to generate a telemetry signal that can be received by low cost receivers and a personal computer. DSP also produces digitized voice that can be received by simple receivers.

The experiment is intended to run during the Chilean academic year (April to November) transmitting one or two times a month. The benefit for the curricula of the students is that they will have to develop at least the following areas of knowledge related to space:

* Satellite tracking.
* Communications.
* Telemetry analysis of electric and thermodynamic parameters.

Mission Control Station, ECM-Santiago.

The ECM-Santiago station is a complete command and control groundstation from the SSTL product line of groundstation systems. Using this system, ground controllers can command the spacecraft both via the direct command link and via the on-board computer, collect and archive telemetry data, interact with the store-and-forward communications system, collect and archive spacecraft housekeeping data as well as data generated from the various experiments resident on the FASat-Alfa spacecraft platform. This will be the only station in Chile capable of controlling satellites, and will be located in a building at Los Cerrillos Air Force Base in Santiago. Installation was completed in February 1995.

The FASat-Alfa commissioning will be undertaken from ECM-Santiago By Chilean and SSTL engineers.

I did a few QSOs with a similar station. Your best bet is CW, try to arrange a schedule so you can work out the bugs. I found calling or answering CQs very difficult. The other operator must be well-equipped and patient. The sat must be in just the right place. All the restrictions reduce your chances, but once you do connect, it is rewarding.
AO-10 is very erratic, try AO-13 also. Look for the low portion of the orbit when signals are stronger.
Traksat has version 3.1, 286 or better required.
I haven't been active on the high-flying birds because my station isn't up to the task. I did make some contacts, but once I build this CCI 432 amp, I plan to get radioactive again.

Subject: Molniya over the pole?

In article <DDs0o7.Ayz@emr1.emr.ca>, stephens@ngis.geod.emr.ca (Dave Stephenson) says:

Russian television via Molniya (Lighting) C-band satellites is SEMI-HARD.

problem 1) Non geosync orbit requiring active tracking with ALT/AZI pointing.
Note a fairly cheap computer can do this ie) Apple][, although
I have heard stories of people MANUALLY re-pointing their dish
every 15-30 mins.

Problem 2) Need a fairly big dish, 10' minimum, 16-32' preferred.

Problem 3) SECAM TV format. can be displayed on multiformat monitors.

Problem 4) Audio not above video but mixed into horiz blanking area.
Note: This has been fixed by them adding 2nd audio signal
above video signal to be more compatable with cheaper
western TVRO RX gear.

Problem 5) Language in Russian. Although the pictures are nice. Its weird
seeing Fraggle Rock dubbed in Russian but they SING in english.

Problem 6) Ocassionally one or more of the Four satellites in the constillation
is 'on the blink'.

Several colleges have a setup to receive this for their Russian Studies.
if you see a dish NOT pointed to the SW, SE or S but to the NE then they have
such a setup. U of IA and Crighton in Omaha come to mind.

There are a few firms out there that will sell you a turnkey system installed for
about $50,000-$100,000.

If you live EAST of the Missippi or better yet east of the OHIO river vallely
you can pick up the signal from their Geo-sync birds.

Hope this helps.

~~~~~~

Dave, it is my understanding that the orbit being eliptical and having redundent birds (I believe there were
three), another bird is in the beamwidth of your dish before you lose signal from the first. The other problems
agree with my what I have read.

If you can afford it, Instant Track is propably the best tracking
program. Do a net search for amsat. I think you have to order it
via the phone with a credit card. Several of the sat gurus around here
use it. At the Amsat.ftp archive they have several different freeware/
shareware trackers. I know that IT supports computer control of your
rotor. I use PREDICT.EXE, it is a freeware text only tracker, schedular.
You can get the orbital elements for the airforce ftp. Since I switched
to netscape I can not quickly find net addresses. Do a net search.
Yesterday I downloaded a new(for me) tracker. STSORBIT. It appears
(from reading the docs) to be a good program. I think it came from the
AMSAT ftp, but I could have got it from the ARRL ftp sit..or to tell the
truth I was out netting and went all over the worl tracking down ham. I
was trying to find a German ftp site with the rumured new version of
JVFAX 8.0.
I am into NOAA WX sats and do not really know much about ham digital
formats. I suspect it is fairly high speed PSK. My MFJ1278 only does
AX25 1200buad, RTTY and AMTOR. You might post to the REC.RADIO.DIGITAL.
MISC. Those guys are into all sorts of digital stuff.
I hope some of this helps.

Try Down East Microwave. I don't think that they have one that goes
directly from 440 to 28 but they will have ones that go from 144 to
28 and from 440 to 144. They have them all the way up to 10GHz.
They have a pretty good assortment of linear amps for 440 and
144 too. Sorry I don't have the address or phone number but they
are usually in QST, CQ and 73 mags.

Subject: Help, keepers for elements

Help, I need some stainless steel keepers for 3/16 and 1/4 rod
for a satellite antenna. Keepers are the retainers that look like
none slip washers and fit over antenna elements.
Rutland Arrays used to supply them, but both their past telephone
numbers are now out of service and they do not reply to mail.

Anyone know of another supplier of small numbers of antenna parts?
Thanks.

From: tfugate@service1.uky.edu (Terry Fugate)
Subject: JVFAX APT CONFUSION

I have received several Emails concerning a reply that I had made
regarding NOAA APT reception with JVFAX 7.0. I was told that
"you can only receive hf style sefax with the 'simplest' demodulator"
Diagram AMFMFAX.GIF show a circuit using the XR2206. This is a
converter that goes in front of the op-amp cirucit. It detects the
AM NAOO APT FAX and CONVERTS it into a FM(HF) FAX signal. The diagram
text is in GERMAN but the circuit does work and works fairly well.
It is a full wave detector driving a VCO. There is a graph,
AMFMFAX1.GIF, that show the transfer curve. It is reasonalbly linear.
I used a 8ohm to 1000ohm transformer. I used a 2n2222 for T1.
While I now use a better demodulator, I decided to keep this one around
for field operation.
TO any and all that emailed me, I am sorry to reply this way, but UK is
having MAJOR mail problems. They switched us all from CC mail to Eudora.
I have had a nightmare trying to post mail off campus and have been
told by freinds that a lot of mail sent to me is bouncing. Our campus
access to the news groups has been kind of spooty also.
The bottom line is this simple method does work. And, while a better
demodulator is a real good idea, you can toss the "simplest" adaptor and
the xr2206 converter togather in a evening. The only problem that the
simplest/xr2206 had was in saving. My old pc, a 20mc 80386, just got
"lost" while trying to save images.(or it might have been the MAXTOR
hard file..it was a GREEN energy saver that would auto-spin down.
You could hear the drive stop and then tJVFAX would lock up..sometimes)
I tried it again last night on NOAA12, I had a good 50 degree pass last
night, and captured the entire pass with the simplest/XR2206 demod.
I currently have a 80486DX66(I use the maxtor as my boot drive(c:) and
capture to a seagate 80meg). Give it a shot. It is a thrill to see your
first capture.
Oh, and don't try to record the pass on audio tape and expect to play
it back and captur it after the fact. Almost all audio tape recorders,
either reeel to rel or cassette, have so much wow and flutter that the
resultant image will be barely if at all usefull. You might be able to
record the pass on a VHS vcr and play it back. Be sure to feed a good
stong clean local video signal in the video input.(most home vcrs will
allow you to tune in a local tv station and plug in an external audio
source). VCRs have a seperate control track that might keep the tape
speed constant(or least close enouge for our purposes). I have had good
luck with a borrowed NAGRA reel to reel audio recorder. The NAGRA was
designed to be used with a file camera and has a 100hz crystal
refferenced audio track. During playback it "locks" the tape speed to
the internal clock. I mention this just to save you the frustration that
I have already been through in trying to tape a pass.

>agree with my what I have read.
>
>Ken mbv@ti.com

If you have a BEAM that wide you need REALLY good signal processing to
get the signal back out.

Most dishes have a beam 1-2 degrees wide, about 2-4 full moon widths.
It's a BIG sky, over 25,000 places to point and only a few will work.
The satellites are NOT that close together. EVERY working system
I've seen has ACTIVE alt-azi pointing that updates the position every
few seconds. The Apple][system used TLEs to get close when the bird
came up then used a 'random move'/ signal strength check to track.
(hey... it worked...)

BTW:
Problem 7:

There is a few minutes of signal dropout when EVERYBODY switches to the
NEXT 'rising' satellite when the current one 'sets'.

Sorta like our Geosync Sun outages except it happens several times each
day.

: three), another bird is in the beamwidth of your dish before you lose signal from the first. The other problems
: agree with my what I have read.

: Ken mbv@ti.com

I did not ask the original question. Yes the Molniya birds are in
Molniya orbits (what else) and usually have 3 operational birds plus
one running spare plus some stand bys. Of course there are also the
military com sats and presumably still some U.S. jumpseats up there
chasing each other in orbits similar to the initial orbit of Oscar 13.
The problems of tracking a Molniya should be about the same as tracking
Oscar 13 with a microwave dish.

Thanks for bringing me up to date on those birds.

William,

the SatTrack (V3.1) implementation of the SGP4 model has a typical
precision of better than 10 minutes of arc in azimuth and elevation angles
for typical orbit predictions with two-line element sets that are not more
than a few days old. The calculations of the latitude and longitude of the
sub-satellite point are even more precise. A lot depends on how old your
two-line element sets are.

For more details check the SatTrack web page at:

http://ssl.berkeley.edu/isi_www/sattrack.html

Subject: Wisp, KCT, and Win95

I haven't done this yet, but the problem has been well described on AMSAT-BB and also on the digital satellites. You need to setup the KCT/T under "old Windows". It will then run fine under WIN95, but in order to edit the setup file in WIN95, you'll have to manually edit the KCT/T.INI file (not it's correct name, but the appropriate "INI" file).

Chris Jackson is working on the driver for the KCT/T so that you can alter it in the usual way under WIN95. It'll probably be a month or so. Try setting it up on a computer under "old Windows" then copy the appropriate "INI" file to your WIN95. That should work fine for now.

Dave, for the information you need start with http://amsat.org/amsat/AmsatHome.html
or contact Paul Williamson KB5MU at kb5mu@amsat.org.

I believe from what I've read that mode LS (1296 up 2400 down) will be
the most active. Mode S (450 up 2400 down) may be the most active at
first until more equip. is available on 1296 at reasonable prices.

1890. AO-27 SCHEDULE

Newsgroup: rec.radio.amateur.space
Date: 1995-09-05 00:00:00 UTC
From: mbv@ti.com
Message-ID: <42iftq$l6u@superb.csc.ti.com>
Source record: 24198

I gave up on AO-27 several months ago after it went off the air totally due to unknown (to me) causes. It had been operational during daylight hours on weekends only. Last weekend I was surprised to find it up and running and I could even hear it on my talkies rubber-ducky. Several Hams heard on the satellite mentioned that it was operational 7 days a week during daylight hours.

After much sweating in the Texas sun, I got the talkie, duplexer, 140 Watt amplifier and two antennas installed on the van. Instantrack showed that a pass would AOS at about 12:17 PM today. I listened for 20 minutes and heard....nothing.

Is this satellite functional during the week or is the schedule sporadic like it used to be?

DEM is at 908-996-3584, in Frenchtown, NJ. At home, as I type, a partially assembled DEM 432-28mhz transverter sits on my bench. This is the design that is intended as an IF transverter for use behind a 10.368Ghz transverter. It is a nice, but bare bones kit, with separate Rx/Tx ports for both the 28mhz IF and the 432 side, and about a 4db NF, as I recall. (Remember this is an IF transverter) It sold for $109. When I have it up and running, my intent is to pick up the 10G modular transverter system. Steve also sells a high performance kit, with options available for switching, power, and packaging. I don't have the specs handy, but give him a call if you're interested.

Hello;

I have bought an old spectrum analizer and a 3 element Yaqi. The
frequencies of the machine are 20-79 Mhz, 120-179 Mhz, 450-519 Mhz.
Any help on a frequency to listen to would be appreciated...
Thanks...

Mike

>REGROSS1@aol.com
I would give them consideration for use with the 1200 baud birds. If
you lived in a part of the world with low amateur density, they would
be fairly suitable on the 9600 birds. The competition over North
America and Europe is very high, with many high powered stations using
AZ/EL setups. Your Eggbeater setup just doesn't quite make it.
You definately need a good quality pre-amp for the downlink. I would
recommend that you order the ground-plane kit for each as well.

I switched to the M2 Oscar antennas with the Yaesu G5400B AZ/EL setup
and the Landwehr pre-amps. The antennas are controlled with the
KCTracker.

Good luck.

From: rick.edwards@mogur.com (Rick Edwards)
Subject: TM-742A

I have a new 742A. It is a great radio! I enjoy it very much.
However, I do have a couple of questions that I can't seem to find the
answer to in the manual. Maybe you can help me.

1) When using the autodialer, the button sequence is PTT, PF, & then the
autodialer memory number (#1 in my case). The transmitter turns on when
the PTT is pressed, of course, but then turns off when the PF button is
pressed and then back on for the DTMF string. However, there is no (or
very little) pause between the transmitter turn on and the sending out
of DTMF. I use two repeater autopatches and neither of them likes this
and it _usually_ results in a misdial. Question: Is there anyway to
add a pause or a brief wait between the transmitter turning back on and
the output of DTMF?

2) When using the 742A in a crossband repeat mode between a 220
repeater and my 2m HT, I have to wait for the 220 repeater to drop
before I can transmit. This becomes a real drag when on a roundtable
on the 220 repeater and it has a long hang time. Is there anyway
around this? Is there a way to make the 742A act like a single
frequency repeater on the 2m side (ie. sample the receive every few
hundred milliseconds)?

Thanks....<re>

I am answering my own article. It was not the "debug" command. The
diagnostics were caused by the "trace" command in pg.tnc Now PG and PB
work great with my AEA DSP-1232.

I check into the Molniya satellites awhile ago, and found that the
satellites are no longer transmitting TV signals. I cannot personally
confirm this.

Subject: Molniya over the pole?

In article <DDs0o7.Ayz@emr1.emr.ca>, stephens@ngis.geod.emr.ca (Dave Stephenson) says:

Russian television via Molniya (Lighting) C-band satellites is SEMI-HARD.

problem 1) Non geosync orbit requiring active tracking with ALT/AZI pointing.
Note a fairly cheap computer can do this ie) Apple][, although
I have heard stories of people MANUALLY re-pointing their dish
every 15-30 mins.

Problem 2) Need a fairly big dish, 10' minimum, 16-32' preferred.

Problem 3) SECAM TV format. can be displayed on multiformat monitors.

Problem 4) Audio not above video but mixed into horiz blanking area.
Note: This has been fixed by them adding 2nd audio signal
above video signal to be more compatable with cheaper
western TVRO RX gear.

Problem 5) Language in Russian. Although the pictures are nice. Its weird
seeing Fraggle Rock dubbed in Russian but they SING in english.

Problem 6) Ocassionally one or more of the Four satellites in the constillation
is 'on the blink'.

Several colleges have a setup to receive this for their Russian Studies.
if you see a dish NOT pointed to the SW, SE or S but to the NE then they have
such a setup. U of IA and Crighton in Omaha come to mind.

There are a few firms out there that will sell you a turnkey system installed for
about $50,000-$100,000.

If you live EAST of the Missippi or better yet east of the OHIO river vallely
you can pick up the signal from their Geo-sync birds.

Hope this helps.

~~~~~~
~~~~~~~~~~~~~~~~~~~~~~~

Dave, it is my understanding that the orbit being eliptical and having redundent birds (I believe there were
three), another bird is in the beamwidth of your dish before you lose signal from the first. The other problems
agree with my what I have read.

If you can afford it, Instant Track is propably the best tracking
program. Do a net search for amsat. I think you have to order it
via the phone with a credit card. Several of the sat gurus around here
use it. At the Amsat.ftp archive they have several different freeware/
shareware trackers. I know that IT supports computer control of your
rotor. I use PREDICT.EXE, it is a freeware text only tracker, schedular.
You can get the orbital elements for the airforce ftp. Since I switched
to netscape I can not quickly find net addresses. Do a net search.
Yesterday I downloaded a new(for me) tracker. STSORBIT. It appears
(from reading the docs) to be a good program. I think it came from the
AMSAT ftp, but I could have got it from the ARRL ftp sit..or to tell the
truth I was out netting and went all over the worl tracking down ham. I

was trying to find a German ftp site with the rumured new version of
JVFAX 8.0.
I am into NOAA WX sats and do not really know much about ham digital
formats. I suspect it is fairly high speed PSK. My MFJ1278 only does
AX25 1200buad, RTTY and AMTOR. You might post to the REC.RADIO.DIGITAL.
MISC. Those guys are into all sorts of digital stuff.
I hope some of this helps.

if you see a dish NOT pointed to the SW, SE or S but to the NE then they have
such a setup. U of IA and Crighton in Omaha come to mind.

There are a few firms out there that will sell you a turnkey system installed for
about $50,000-$100,000.

If you live EAST of the Missippi or better yet east of the OHIO river vallely
you can pick up the signal from their Geo-sync birds.

Hope this helps.

Does anyone access domestic Russian television from Molniya satellites,
over the north pole? How difficult is it to do it? Can I use surplus
C-band equipment?
If you know of a good written description of how to do this little stunt,
I'd really like to know the title of the publication reference.

~~~~~~

Dave, it is my understanding that the orbit being eliptical and having redundent birds (I believe there were
three), another bird is in the beamwidth of your dish before you lose signal from the first. The other problems
~~~~~~

agree with my what I have read.

If you can afford it, Instant Track is propably the best tracking
program. Do a net search for amsat. I think you have to order it
via the phone with a credit card. Several of the sat gurus around here
use it. At the Amsat.ftp archive they have several different freeware/
shareware trackers. I know that IT supports computer control of your
rotor. I use PREDICT.EXE, it is a freeware text only tracker, schedular.
You can get the orbital elements for the airforce ftp. Since I switched
to netscape I can not quickly find net addresses. Do a net search.
Yesterday I downloaded a new(for me) tracker. STSORBIT. It appears
(from reading the docs) to be a good program. I think it came from the
AMSAT ftp, but I could have got it from the ARRL ftp sit..or to tell the
truth I was out netting and went all over the worl tracking down ham. I
was trying to find a German ftp site with the rumured new version of
JVFAX 8.0.
I am into NOAA WX sats and do not really know much about ham digital
formats. I suspect it is fairly high speed PSK. My MFJ1278 only does
AX25 1200buad, RTTY and AMTOR. You might post to the REC.RADIO.DIGITAL.
MISC. Those guys are into all sorts of digital stuff.
I hope some of this helps.

From: tfugate@service1.uky.edu (Terry Fugate)
Subject: JVFAX APT CONFUSION

I have received several Emails concerning a reply that I had made
regarding NOAA APT reception with JVFAX 7.0. I was told that
"you can only receive hf style sefax with the 'simplest' demodulator"
Diagram AMFMFAX.GIF show a circuit using the XR2206. This is a
converter that goes in front of the op-amp cirucit. It detects the
AM NAOO APT FAX and CONVERTS it into a FM(HF) FAX signal. The diagram
text is in GERMAN but the circuit does work and works fairly well.
It is a full wave detector driving a VCO. There is a graph,
AMFMFAX1.GIF, that show the transfer curve. It is reasonalbly linear.

I used a 8ohm to 1000ohm transformer. I used a 2n2222 for T1.
While I now use a better demodulator, I decided to keep this one around
for field operation.
TO any and all that emailed me, I am sorry to reply this way, but UK is
having MAJOR mail problems. They switched us all from CC mail to Eudora.
I have had a nightmare trying to post mail off campus and have been
told by freinds that a lot of mail sent to me is bouncing. Our campus
access to the news groups has been kind of spooty also.
The bottom line is this simple method does work. And, while a better
demodulator is a real good idea, you can toss the "simplest" adaptor and
the xr2206 converter togather in a evening. The only problem that the
simplest/xr2206 had was in saving. My old pc, a 20mc 80386, just got
"lost" while trying to save images.(or it might have been the MAXTOR
hard file..it was a GREEN energy saver that would auto-spin down.
You could hear the drive stop and then tJVFAX would lock up..sometimes)
I tried it again last night on NOAA12, I had a good 50 degree pass last
night, and captured the entire pass with the simplest/XR2206 demod.
I currently have a 80486DX66(I use the maxtor as my boot drive(c:) and
capture to a seagate 80meg). Give it a shot. It is a thrill to see your
first capture.
Oh, and don't try to record the pass on audio tape and expect to play
it back and captur it after the fact. Almost all audio tape recorders,
either reeel to rel or cassette, have so much wow and flutter that the
resultant image will be barely if at all usefull. You might be able to
record the pass on a VHS vcr and play it back. Be sure to feed a good
stong clean local video signal in the video input.(most home vcrs will
allow you to tune in a local tv station and plug in an external audio
source). VCRs have a seperate control track that might keep the tape
speed constant(or least close enouge for our purposes). I have had good
luck with a borrowed NAGRA reel to reel audio recorder. The NAGRA was
designed to be used with a file camera and has a 100hz crystal
refferenced audio track. During playback it "locks" the tape speed to
the internal clock. I mention this just to save you the frustration that
I have already been through in trying to tape a pass.

>
>Ken mbv@ti.com

If you have a BEAM that wide you need REALLY good signal processing to
get the signal back out.

Most dishes have a beam 1-2 degrees wide, about 2-4 full moon widths.
It's a BIG sky, over 25,000 places to point and only a few will work.
The satellites are NOT that close together. EVERY working system
I've seen has ACTIVE alt-azi pointing that updates the position every
few seconds. The Apple][system used TLEs to get close when the bird
came up then used a 'random move'/ signal strength check to track.
(hey... it worked...)

BTW:
Problem 7:
There is a few minutes of signal dropout when EVERYBODY switches to the
NEXT 'rising' satellite when the current one 'sets'.

Sorta like our Geosync Sun outages except it happens several times each
day.

Problem 7) They have circularized (left/right)polarization and we have
linear (horiz/vert) signals. Yet another adaptor required.
Actually just cram a 'special' piece of plastic in your feed
horn.

Problem 8) There is a few minutes of signal loss every 6 hrs or so when
EVERYBODY switches from the setting satellite to the Rising
satellite. Sorta like our solar outages except its several
times EVERY day.

: Ken mbv@ti.com

I did not ask the original question. Yes the Molniya birds are in
Molniya orbits (what else) and usually have 3 operational birds plus
one running spare plus some stand bys. Of course there are also the
military com sats and presumably still some U.S. jumpseats up there
chasing each other in orbits similar to the initial orbit of Oscar 13.
The problems of tracking a Molniya should be about the same as tracking
Oscar 13 with a microwave dish.

Thanks for bringing me up to date on those birds.

William,

the SatTrack (V3.1) implementation of the SGP4 model has a typical
precision of better than 10 minutes of arc in azimuth and elevation angles
for typical orbit predictions with two-line element sets that are not more
than a few days old. The calculations of the latitude and longitude of the
sub-satellite point are even more precise. A lot depends on how old your
two-line element sets are.

For more details check the SatTrack web page at:

http://ssl.berkeley.edu/isi_www/sattrack.html

Subject: Wisp, KCT, and Win95

I haven't done this yet, but the problem has been well
described on AMSAT-BB and also on the digital satellites. You
need to setup the KCT/T under "old Windows". It will then run
fine under WIN95, but in order to edit the setup file in WIN95,
you'll have to manually edit the KCT/T.INI file (not it's
correct name, but the appropriate "INI" file).

Chris Jackson is working on the driver for the KCT/T so that you
can alter it in the usual way under WIN95. It'll probably be a
month or so. Try setting it up on a computer under "old
Windows" then copy the appropriate "INI" file to your WIN95.
That should work fine for now.

From: Ed Garnett <ejg@acslink.net.au>
Subject: What Pre-Amps?

Hi All,

My question is... does it matter?!

Certainly for 2mx it doesn't... I'd suggest saving your $ for the 70cm
preamp...
At my station I use a homebrew 'fet' (not gaAs fet) preamp 'at the rig' which
provides more than enough performance (this unit was tuned on air monitoring
the AO-13 beacon!!). The 2mx antenna is a 20 element X-yagi.

For 70cm however, the story changes significantly...
Here, I use a commercial Mirage 70cm gaAs fet preamp. (There are probably
better
quality units about but...) I use it mainly for 'low pass' digital spacecraft
passes, just to get that few extra minutes connect time! Again, its mounted in
the shack... yes I know, it would never do for 'moon bounce' but...

I guess, what I'm suggesting is, don't go to too much bother for 2mx satellite!
Just about anything will do, just to lift the signal above the noise floor.
Certainly don't bother putting it up the mast!! you won't be able to tell the
difference!!!

70cm is another story... it will depend what you will mainly be using it for.
Here, a mast mount preamp is most desirable and it may pay to invest in a
good quality unit. I don't have the test eqipment available to me now days, so
I opt for a commercial unit!

I think that is important to know when to 'build or buy'! Thats the difference
between success and wasting money!

happy hammin' Ted VK1BL.

@ORIGIN :@Fido N
Hello,

I happen to be totally blind so diagrams don't do me much good
needless to say. :-) I would appreciate it if someone could e-mail
me
some basic information on the turnstile (sp?) antenna for 29 MHz RS
satellite downlink reception.

A brief general statement about the antenna as well as some basic
design info and how its physically constructed.

I don't mind tackling a construction project but I do need some
help on basic design and construction, phasing line dimensions, and
basically how the antenna might be constructed.

Any help on this would be deeply appreciated.

1897. NORAD Two-Line Orbital Element Set Format

Newsgroup: rec.radio.amateur.space
Date: 1995-09-06 00:00:00 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.810351943@dolphin>
Source record: 24205

As a service to the satellite user community, the following description of the NORAD two-line orbital element set format is uploaded to sci.space.news and rec.radio.amateur.space on a monthly basis. The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (334) 409-9280, and are updated daily (when possible). Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at speeds up to 28,800 bps using 8 data bits, 1 stop bit, no parity. In addition, element sets (updated daily) and some documentation and software are also available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

==========

Data for each satellite consists of three lines in the following format:

```
AAAAAAAAAAAAAAAAAAAAA
1 NNNNNU NNNNNAAA NNNNN.NNNNNNNN +.NNNNNNNN +NNNNN-N +NNNNN-N N NNNNN
2 NNNNN NNN.NNNN NNN.NNNN NNNNNNN NNN.NNNN NNN.NNNN NN.NNNNNNNNNNNNN
```

Line 0 is a twenty-two-character name (this change is being made to be consistent with the name length in the NORAD SATCAT).

Lines 1 and 2 are the standard Two-Line Orbital Element Set Format identical to that used by NORAD and NASA. The format description is:

```
Line 1
Column Description
01-01 Line Number of Element Data
03-07 Satellite Number
10-11 International Designator (Last two digits of launch year)
12-14 International Designator (Launch number of the year)
15-17 International Designator (Piece of launch)
19-20 Epoch Year (Last two digits of year)
21-32 Epoch (Julian Day and fractional portion of the day)
34-43 First Time Derivative of the Mean Motion
or Ballistic Coefficient (Depending on ephemeris type)
45-52 Second Time Derivative of Mean Motion (decimal point assumed;
blank if N/A)
54-61 BSTAR drag term if GP4 general perturbation theory was used.
Otherwise, radiation pressure coefficient. (Decimal point assumed)
63-63 Ephemeris type
65-68 Element number
69-69 Check Sum (Modulo 10)
(Letters, blanks, periods, plus signs = 0; minus signs = 1)
```

Line 2
Column Description
01-01 Line Number of Element Data
03-07 Satellite Number
09-16 Inclination [Degrees]
18-25 Right Ascension of the Ascending Node [Degrees]
27-33 Eccentricity (decimal point assumed)
35-42 Argument of Perigee [Degrees]
44-51 Mean Anomaly [Degrees]
53-63 Mean Motion [Revs per day]
64-68 Revolution number at epoch [Revs]
69-69 Check Sum (Modulo 10)

All other columns are blank or fixed.

Example:

NOAA 6
1 11416U 86 50.28438588 0.00000140 67960-4 0 5293
2 11416 98.5105 69.3305 0012788 63.2828 296.9658 14.24899292346978

: 3am if they sleep then.

: BUSTER
Mir stays on Moscow time. I'm in the Eastern US and have found that early morning passes ~7:00 EST are best. If you stay up late after ~1:30 is also OK. "Prime time" 6:00PM-Midnight is right in the middle of their sleep period, so contacts are rare. Good Luck! & 73 de N2OWV

>Will STS-69 be a SAREX mission and how do we find out which
>missions will be?

STS-69 pilot Ken Cockrell did get his ham license for his previous
shuttle flight (STS-56) and there was some preliminary discussion about
manifesting SAREX on STS-69, but the decision was made no to.

Unfortunately while many people would like to fly SAREX on every single
mission it can't be done. Most of the SAREX team members are volunteers,
and have full time jobs which take priority - especially those who are
responsible for the actual day-to-day shuttle operations!

In addition it costs $$$$$ to make up the QSL cards for each mission.

At the present the SAREX team is supporting about 4 missions each year,
or about half of the shuttle flights.

For the remainder of this calendar year the only planned SAREX mission is
STS-74, the second Mir docking. It's planned for late October and will
include commander Ken Cameron KB5AWP and mission specialists Bill
McArthur KC5ACR, Jerry Ross N5SCW (I think - this is off the top of my
head), and non-licensed astronauts pilot Jim Halsell and mission
specialist Chris Hadfield. It's only a six day mission but it has
several enthusiastic hams on board so I'd expect a bunch of ham activity.

Several missions for next year (1996) have been discussed as potential
SAREX flights. The SAREX principal investigator Matt Bordelon KC5BTL
will be presenting a paper on SAREX's status at the AMSAT Symposium in
October and I'm certain he'll be talking about which missions and which
astronauts will be getting their licenses.

For more info on the Symposium check out the AMSAT WWW page.

>
Hmmm... I know that my father (WA4DYD) has been getting his GEOS-8 station
set up and he has not complained about anything... actually he was out testing
his receive converter at around 7-8pm Eastern time recently and was receiving
the signal with a single 44 -element loop yagi and no pre-amp.

What kind of grey scale resolution can you receive with the QFAX card?
256 level? Also, where can one purchase such a card? My father is in
the process of building one to go into his PC... I was thinking about
writing the software for Linux.

1904. 29 MHz. Turnstile help

Newsgroup: rec.radio.amateur.space
Date: 1995-09-06 00:00:00 UTC
From: pjgraziani@ualr.edu
Message-ID: <1995Sep6.191856@ualr.edu>
Source record: 24212

Hello,

I happen to be totally blind so diagrams don't do me much good needless to say. :-) I would appreciate it if someone could e-mail me some basic information on the turnstile (sp?) antenna for 29 MHz RS satellite downlink reception.

A brief general statement about the antenna as well as some basic design info and how its physically constructed.

I don't mind tackling a construction project but I do need some help on basic design and construction, phasing line dimensions, and basically how the antenna might be constructed.

Any help on this would be deeply appreciated.

From: Douglas Braun <dbraun@hol.gr>
Message-ID: <42klp7$t9s@newsflash.hol.gr>
Source record: 24213

Is AO-11 (also known as RS-14) still alive?
I haven't heard anything in several days of trying on 145.987.

Also, does anyone know if the UO-11 S-band becaon works?
If you know the answer to that, perhaps you could also
tell me: What other satellites (besides AO-13, of course)
have S-band beacons?

Thanks a lot,

Doug Braun (SV/N1OWU)

1907. Bird Dog vs Chara

Newsgroup: rec.radio.amateur.space
Date: 1995-09-07 00:00:00 UTC
From: wallnerw@crash.cts.com
Message-ID: <DEInCD.Jvo@crash.cts.com>
Source record: 24116

Hello all,

I have simply an optical interest in watching and knowing the identity of EOS passing over Southern California. I installed Bird Dog and have TLE669. However, I have been unable to confirm, visually, the overflight "win"dows it produces. I am *reasonably* confident I have correct "station" numbers.

When I compare the windows listed by Bird Dog, they are off by about 30 minutes when compared with the predictions I get from chara.gsu.edu. I do believe I confirmed (with only a 2 minute error) Mir last night (9/5) based on the chara prediction so, I tend to doubt Bird Dog.

I have a hand-held scanner tuned to 145.2, 145.55 and 145.8. Based on their work schedule as previously posted here, should I be able to pick up any voice?

TIA

Are there any files or programs for the Macintosh, ie. is this a PC/Mac compatible cd-rom?

I use a Power-Mac and have Softwindows to run Dos and windows software, but I prefer native software for the speed and ease of use. Can I use your product with my system?

I've been chasing MIR regularly for several years. If the Cosmonauts are up and working, you may here something. It may be voice, but more likely it will be digital packet transmissions from earth stations to the satellite and return. I've been monitoring the space station for several weeks without hearing a peep out of them since the docking mission with "Atlantis". You should listen to 145.550 for downlink from both MIR and the shuttle fleet. It's hard to confirm the bird when you can't hear or see it.

>Thanks much..

Suggestion - why don't you do it? It's an excellent service to the local
amateur radio community, and you'll earn the appreciation of the local
ham community, and space enthusiasts.

Or get together with a bunch of space enthusiasts and hams and get
together the resources.

Check your time zone. It may seem obvious, but in many many cases I've
discovered that I've inputted the wrong time zone (or daylight savings
time). There's no way any reasonable tracking program could be off by
half an hour.

>I have a hand-held scanner tuned to 145.2, 145.55 and 145.8. Based on
their
>work schedule as previously posted here, should I be able to pick up any
>voice?

A handheld scanner or two meter transciever with a rubber-duckie is
enough to hear Mir or the hsuttle quite clearly. Provided --- that they
are using their ham equipment. (for example you will *NOT* hear any ham
radio from the STS-69 or STS-73 shuttle missions because they don't have
ham radio equipment onboard). The Mir radio is off and on, depending on
the cosmonauts work schedule, and power budget. On occasion Mir's in a
bad attitude where the antenna is blocked, but that's the exception
rather than the rule.

I dont consider this a spam at all. Actually they are all places
where people who might get benefit from this fine product can be
found and they might appreciate knowing where they can get this
CDROM.

1921. NORAD Two-Line Orbital Element Sets (TLE672)

Newsgroup: rec.radio.amateur.space
Date: 1995-09-09 00:00:00 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.810610373@dolphin>
Source record: 24129

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (334) 409-9280, and are updated daily (when possible). Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at speeds up to 28,800 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily) and some documentation and software are available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space.news and rec.radio.amateur.space. This week's elements are provided below.

1922. NORAD Two-Line Orbital Element Set: Space Shuttle (95251.22959491)

Newsgroup: rec.radio.amateur.space
Date: 1995-09-09 00:00:00 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.810610499@dolphin>
Source record: 24130

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (334) 409-9280, and are updated daily (when possible). Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current elements for the current shuttle mission are provided below. The Celestial BBS may be accessed 24 hours/day at speeds up to 28,800 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily), shuttle elements, and some documentation and software are also available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

Warren
The best program I have found so far is STS-Plus. I think the latest
ver is 9517. This is the best in book and very accurate. You cna get
it from ftp.amsat.org. I dont know which ver. they have.

1926. MIR Keplerian Elements

Newsgroup: rec.radio.amateur.space
Date: 1995-09-09 00:00:00 UTC
From: rafaels@zimmer.CSUFresno.EDU
Message-ID: <DEM7HL.F6y@CSUFresno.EDU>
Source record: 24134

Can someone post the latest MIR Keps?

Thanks

Rafael (KE6JSR)

1927. Radio Meteor Obs Bulletin Aug 1995: the mighty Perseids

Newsgroup: rec.radio.amateur.space
Date: 1995-09-09 00:00:00 UTC
From: steyaert@vvs.innet.be
Message-ID: <steyaert.11.0015B259@vvs.innet.be>
Source record: 24135

Radio Meteor Observation Bulletin No. 25 Sep 1995

1. FORWARD SCATTER METEOR OBSERVATIONS

Observer: Thomas Ashcraft
Location: Santa Fe, New Mexico, USA (35 42' N, 105 57' W)
Frequencies: 98.1 MHz (primary) 87.65 MHz (secondary)
Transmitters: Multiple transmitters received. Still identifying them.
KHAK-FM Cedar Rapids, Iowa 100 kW 1300 km distance
Receivers: Sangean ATS-803A (primary) Technics SA-160 (secondary)
Antenna: Six element directional FM yagi (Radio Shack part # 15-1636)
Azimuth: 70 degrees east of magnetic north Ant. Elevation: 45 degrees
Observing method: Listening and counting in real time or during audio tape
playback. I make a second by second count and also note
duration of each reflection and any significant qualities.
WWV universal time is also recorded on the audio tapes.

August 1995

Notes:

. Please note that the numbers above do not show the amount of long duration Perseid reflections received. During the first peak hours of the Perseid shower (August 12 1700h UT-1900h UT) there were numerous long duration receptions bringing in multiple simultaneous transmitters.

. xx means I have an audio tape for this hour but it is uncounted. I have not have time to tally all the collected tapes but will keep them as a record for processing if ever needed.

. Also, I am expanding my radio meteor observatory by adding more radios and antennas and am now working simultaneously at different frequencies with various antenna array configurations. Early results are interesting in that I am noting many individual meteor reflections occuring on all frequencies a split second apart, up or down in MHz. I am experimenting with different configurations and plan to pursue this activity further. I think I can say now that I have also manifested a "radio fireball observatory." I have invested in a VHS recorder for audio taping purposes and plan to record forward scatter frequencies full time. I hope to be able to confirm visual sightings that occur over North America.

If anyone in the western half of North America is interested in engaging in some joint radio meteor observing projects, please feel free to contact me.

Last note. The Radio Shack 15-1636 FM antenna has been discontinued but still can be purchased for $7.98 if you can find one. It is a functional antenna and can fold up to be portable. Radio Shacks have their stock listed on computer so you can telephone any store to find out area availability.

Thomas Ashcraft

Observer: Maurice De Meyere
Location: Deurle, Belgium (3 37' E, 51 00' N)
Frequency: 66.60 MHz, 66.3 MHz from August 14
Transmitter locations:
Gdansk, PR3, Poland, 66.29 MHz, 89 kW, distance 1100 km
Birlad, PR1 Romania, 66.36 MHz, 46 kW
Sibu, PR1 Romania, 66.44 MHz, 40 kW
Bucuresti Romania
Antenna: crossed Yagi, 4 elements, astronomical azimuth 270 o (= East), elevation 30 o
Antenna amplifier: 25 dB max level 90 dBmuV
Receiver: commercial, Progresson 447A, TESLA, Bratislava

Sensitivity: 8 muV for S/N = 26 dB (300 Ohm)
Observing method: automated setup, 150 samples/second, 8 bit resolution.
[Time and details of all individual meteor reflections are stored
on file in the University of Ghent format (Prometeos), and are
available for further analysis. Reduction software for DOS and
Windows available].

Raw counts of reflections with a duration of at least 0.027 s
during one hour interval starting at UT:

Notes:

. Some transmitters are not broadcasting between 2h-5h local time
(Sat-Sun 3h-6h local time) or sometimes longer. (When summer hour is
in use: local time = UT + 2h).

. * sporadic-E
? possibly sporadic-E, to be checked

. very high activity on Aug 12 between 18 and 19h UT, most probably
due to the Perseids secondary peak.

Maurice De Meyere / Chris Steyaert

Observer: Elmano Doria
Location: near Lisboa, Portugal (9 11' W, 38 42' N)
Frequency: 88.950 MHz
Antenna: wire antenna
Receiver: digital ICF-2001 Sony, coaxial to the radio has about 6 meters
of RG-58/U.
Observing method: the signal is taken from the signal meter indicator before
the led indicator. The signal (max.=1.5V) is than fed to a small
contraption with a 741opamp & optical LED.LDR transducer which
connects to the X or Y pins of the game port.
2 seconds integration time.

Counts for one 1 hour periods starting at UT:

12 Aug 12 1995

19h54 7 8.9

Elmano Doria

Observer: Werfried Kuneth, OE8FNK
Location: Villach, Austria (46 37' N, 13 53' E)

Frequency: 59.250 MHz, SSB mode
Supposed Transmitter locations:
TV video carrier from Bucharest, distance about 900 km, east. Several TV audio carriers (AM?) from Italian Locations in Sicily, Bari and Arezzo, distance 400 to 900 km (all south) and possibly other transmitters.
Antenna: dipole with reflector, direction east.
Receiver: AOR AR-8000. No modifications, no preamplifier.
Observing method:
The audio signal is fed into a real time FFT display (FFTDSP program from AF9Y) on the PC where a bandwidth of 2.4 khz is displayed in 2Hz steps (in different colors) and stored every 20 minutes.
All observed carrier frequencies act together like beacons, every meteor reflection produces a distinct whistle, which is recorded easily by the real time FFT program. Usually there are several different transmitters producing visible marks (= meteor reflections) on the display, I count only two of them.
All the .GIF files are stored on a hard disk for later verification (CD-ROM will be available on request).

Counts in one hour intervals starting at UT:

UT | 29 30 31 1 2 3 4 5 6 7 8 9 10 11 12 13 14 15
|Jul Aug

This is the count for the reflections lasting longer than 15 seconds:

| August
UT | 11 12 13

```
-----------------
3h | 7 6 11
4h | 11 14 13
5h | 12 15 17
6h | 6 16 19
7h | 8 14 19
8h | 10 17 13
9h | 8 12 18
10h | 5 12 14
11h | 3 13 16
12h | 3 16 3
13h | 7 8 11
14h | 1 16 6
15h | 3 13 3
16h | 3 7 5
17h | - 8 10
18h | - 14 5
19h | - 8 3
20h | 5 11 -
21h | 7 14 -
------------------
UT | 11 12 13
August
```

The broad Perseid peak is much clearer with these figures.
During the peak from August 12 to August 13, 11h UT the majority
(more than 50%) of the reflections was in the 15+ seconds range.

Werfried Kuneth

Observer: E.P. Bus
Location: Groningen, The Netherlands (6 degr 33' E, 53 degr 13' N)
Frequency: 66.89 MHz
Transmitter location: Krakow, Poland, 120 kW, distance 1010 km
Antenna: Yagi, 3 elements, azimuth 106 degrees (ESE), elevation 12 degrees
Receiver: Bearcat UBC 177XLT Scanning Radio, sensitivity 0.3 microvolt
Observing method: listening

Hourly means of sporadic radio meteors during 15 July - 6 August 1995.
Between brackets the one sigma error.

2. ABOUT THE RMOB

The RMOB is an independent initiative of some workers in the field of radio meteor scatter observations and data reduction. It started in August 1993 in order to spread rapidly the Perseid results via E-mail. Since then, it has appeared monthly, and has gradually been expanded.

Typically it contains: summaries of recent observations, first results of stream activity by radio methods, relations between radio and optical meteors, references to other publications in the field of meteor astronomy and radio scatter techniques, announcements of meetings, short questions and answers, non-commercial (second hand) sale of radio equipment, available software.

Contributors are mentioned, and interested persons are asked to contact them directly.

RMOB can be copied freely in unabridged and unmodified form. Extracts should indicate the source (Radio Meteor Obs Bulletin, month and year).

If you want to subscribe (or unsubscribe) to the E-mail distribution list, please send a message to C. Steyaert.
Those not having access to E-mail can obtain a printed copy free of charge from J. Van Wassenhove (current or back-issues).

1929. Is AO-21 still alive?

Newsgroup: rec.radio.amateur.space
Date: 1995-09-09 00:00:00 UTC
From: douglasbraun@prometheus.hol.gr
Message-ID: <42qp4b$55n@newsflash.hol.gr>
Source record: 24137

Is AO-11 (also known as RS-14) still alive?
I haven't heard anything in several days of trying on 145.987.

Also, does anyone know if the UO-11 S-band becaon works?
If you know the answer to that, perhaps you could also
tell me: What other satellites (besides AO-13, of course)
have S-band beacons?

Thanks a lot,

Doug Braun (SV/N1OWU)

For sale posts belong in rec.radio.swap only. That is the charter of
the newsgroup. Buying, selling, and trading posts do NOT belong in any
other newsgroup in the rec.radio.amateur hierarchy.

This is all explained very nicely in the "Guide to the Personal Radio
Newsgroups," that Jay Maynard posts on the 15th of every month. One
begins to think maybe it should be posted daily. 8^{)

73,
Bob K2PH

1931. tr9500 mods wanted

Newsgroup: rec.radio.amateur.space
Date: 1995-09-10 00:00:00 UTC
From: Graham Shirville <100114.137@CompuServe.COM>
Message-ID: <42udj4$56j$1@mhadf.production.compuserve.com>
Source record: 24139

Hi All,

A friend, G3BGM has a TR9500 which he wants to use for 9600 baud
packet on 144mhz with Mir.

He has not got any details for the mods required and where to
extract the audio from and where to insert the TX audio

I ahve checked the amsat site which has some mods infor but not
for the TR9500 so any help would be much appreciated.

Thanks 73's

Graham G3VZV KO-23/KO-25 and via amsat.org

1932. URGENT HELP : a transceiver for packet and sat ?

Newsgroup: rec.radio.amateur.space
Date: 1995-09-10 00:00:00 UTC
From: cmaion@cipcinsa.insa-lyon.fr
Message-ID: <cmaion.9.30533CD9@cipcinsa.insa-lyon.fr>
Source record: 24140

I am looking for a model of tranceiver that could allow me :

- to use in a first time terrestrial packet network (AFSK)
- to be a start point for a later satellite station

WHAT TYPE OF TRANSCEIVER DO YOU ADVISE ME ?

I am about to buy a second hand IC 245E, have you info about it ? (I only know that it is an old all-mode 2m TX, with 10W power). Would it be a good choice ?

(As a student and new OM, I am looking for a not too expensive solution.)

PLEASE HELP !!!

TNX ...

```
t.com!zombie.ncsc.mil!blackbird.afit.af.mil!dolphin!tkelso
From: tkelso@afit.af.mil (TS Kelso)
Subject: NORAD Two-Line Orbital Element Sets (TLE672)
Date: 9 Sep 95 01:32:53 GMT
Message-ID: <tkelso.810610373@dolphin>
The most current orbital elements from the NORAD two-line element sets are
carried on the Celestial BBS, (334) 409-9280, and are updated daily (when
possible). Documentation and tracking software are also available on this
system. The Celestial BBS may be accessed 24 hours/day at speeds up to
28,800 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily) and some documentation and software are
available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the
directory pub/space.

As a service to the satellite user community, the most current of these
elements are uploaded weekly to sci.space.news and rec.radio.amateur.space.
This week's elements are provided below.

1938. NORAD Two-Line Orbital El

Newsgroup: rec.radio.amateur.space
Date: 1995-09-10 00:00:00 UTC
From: ts.kelso@intac.com
Message-ID: <8B0D03D.002B0003CA.uuout@intac.com>
Source record: 24146

From: tkelso@afit.af.mil (TS Kelso)
Subject: NORAD Two-Line Orbital Element Set: Space Shuttle (95251.22959491)
Date: 9 Sep 95 01:34:59 GMT
Message-ID: <tkelso.810610499@dolphin>
The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (334) 409-9280, and are updated daily (when possible). Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current elements for the current shuttle mission are provided below. The Celestial BBS may be accessed 24 hours/day at speeds up to 28,800 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily), shuttle elements, and some documentation and software are also available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

based
>on the chara prediction so, I tend to doubt Bird Dog.

Check your time zone. It may seem obvious, but in many many cases I've
discovered that I've inputted the wrong time zone (or daylight savings
time). There's no way any reasonable tracking program could be off by
half an hour.

>I have a hand-held scanner tuned to 145.2, 145.55 and 145.8. Based on
their
>work schedule as previously posted here, should I be able to pick up any
>voice?

A handheld scanner or two meter transciever with a rubber-duckie is
enough to hear Mir or the hsuttle quite clearly. Provided --- that they
are using their ham equipment. (for example you will *NOT* hear any ham
radio from the STS-69 or STS-73 shuttle missions because they don't have
ham radio equipment onboard). The Mir radio is off and on, depending on
the cosmonauts work schedule, and power budget. On occasion Mir's in a
bad attitude where the antenna is blocked, but that's the exception
rather than the rule.

>Thanks much..

Suggestion - why don't you do it? It's an excellent service to the local
amateur radio community, and you'll earn the appreciation of the local
ham community, and space enthusiasts.

Or get together with a bunch of space enthusiasts and hams and get
together the resources.

Philip Chien, Earth News - space writer and consultant PCHIEN@IDS.NET

I'm looking for a communications expert to gather data, document and then testify in court. I need someone to identify the frequency (bandwidth) my thoughts are broadcasted on. The transmission must be traced back to the repeaters and ultimatly the source.

Testamony of the transmission and what was personally heard must be included and fees for your services will be paid at time of settlement in dirrect proportion to the settlement. I suspect if you do your job correctly the settlement (and your fees) will be substantial enough to travel from other states to perform your task.

Contact Brad at bstaranto@csupomona.edu or call (909) 595-4010.

[spam emetic removed for sake of viewers]

I see Pete's right back to his spam-grams. What ever happened to
that message he posted a few months back announcing he'd only
post these ads I mean announcements to rec.radio.swap??

Remember, guys, Buckmaster doesn't spam the 'net.

I think it would be better if you shipped your transmitter (head) here so
that I could put it on the test bench :-).

I think I have found your thought broadcast on Galaxy V transponder
27 (the Home Shopping Network). Now where do I collect?? :-)

I *knew* this amazing space modulator would come in handy some day!!

Bob

I though it was Fred Lloyd, AA7BQ, who promised that for his QRZ CDROM.

(BTW I like Pete's compilation very much, although I find that RT Systems' SAM to be a far better callsign program, if that's all one needs. The browse modes for name and callsign searching in SAM are very good.)

Philip,

After providing this service for more than a year and several missions
I had to pull it off the air.
Most of the people listening to it did not know morse code
So how did they know who I was... :->
Running 170 watts on 2 meters (under Vox and audio delay) into a diamond
x500 on a 56' tower this setup covered 50+ miles and could still be
heard on a ht very easily

Reason to terminate

Too many complaints
tooo many know it alls
toooo much hassle to provide dedicated equipment for the LONG duration
flights

I applaud The HF ops who do it wa3nan and the others at least they have the
support of clubs in their adventure

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (334) 409-9280, and are updated daily (when possible). Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current elements for the current shuttle mission are provided below. The Celestial BBS may be accessed 24 hours/day at speeds up to 28,800 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily), shuttle elements, and some documentation and software are also available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

1950. Some PB, PG, and WISP Information

Newsgroup: rec.radio.amateur.space
Date: 1995-09-11 00:00:00 UTC
From: tgliang@eskimo.com
Message-ID: <DErLpC.24G@eskimo.com>
Source record: 24158

I struggled many hours to get my AEA DSP-1232, Yaesu FT-736R, Gateway 4DX2-66V computer, PB, PG, and WISP working together to communicate with KO-23, KO-25, and UO-22. I'd like to share some knowhow to satellite enthusiasts so as to spare some agony. As those with similar equipment know, this combination doesn't work right away. Some of the recommendations on manuals do not work for us; they work only for some "standard" set.

First, the transceiver does not communicate with the TNC with our equipment, at least not normally. If you do not have a copy, download PROCOMM from oak.oakland.edu. Then from its main directory, go to "pub", then "pcblue", and download vol200.zip. Execute PROCOMM with the TNC connected. Hit Enter. If there is no response from the TNC requesting a "*" to start autobaud, manually restart the TNC with the restart button and the on/off power switch at the back. One should see the autobaud message on the PROCOMM screen after one or two tries, and one should follow it by a "*" and Enter. After this there should be a "cmd:" prompt. Then, assuming activity is on TNC port one, enter "alt x", and exit. One can then start PB, PG, or WISP.

There is possibly one more critical step in making PB, PG, and WISP work. In pg.cfg, pb.cfg, and WISP, set the baud rate to 1200, even for the 9600 baud satellites. It sounds ridiculous, but this was one key to success! Windows baud can stay above 1200. In fact, mine is set at 19200.

One should have 9600 baud capability working. My FT-736R was under warranty, and the factory did the modification for free. I should mention that the 9600 FKS baud modification doesn't work for 1200 PSK. I have to use the former VHF 1200 FSK setup. I think the 9600 baud filter is affecting the TNC reception

I hope this provides a jump start!

I assume you mean AO-21. It is dead, with not much outlook for being turned back on. The host satellite, a Russian Cosmos, was turned off by the Russian Command Center due to budget cuts.

>Also, does anyone know if the UO-11 S-band becaon works?

I last checked it about a year ago, and it was on then. It does not have any modulation, just a carrier.

>If you know the answer to that, perhaps you could also
>tell me: What other satellites (besides AO-13, of course)
>have S-band beacons?

DO-17 has one from time to time. I believe that it is off at this time. There are reports here occasionally.

If DO-17 isn't full quieting, you may not copy many packets per pass.
Try setting PASSALL ON, or WHYNOT ON. The first will print something
even on incomplete packets. The second will tell you why nothing
printed. Also, you may need to adjust the "threshold" control on the
PK232 a bit.

Work like this requires the use of a Bi-Phase Multicomplicator. Most BPM's these days that can track the relatively low frequencies (8-10 Hertz) that brainwaves emit are hard to come by, due to the aging of the Iridium crystals. These crystals become unstable with age, and provide inaccurate results - in once case that I was told of, the BPM actually measured someone else's brainwaves in an adjacent room!

The other problem is locating the repeaters and the path of transmission. This requires some
very high-level Fast-Fourier Transform math, so 80286 processors are definitely out. The propagation path is another problem, since frequencies at this level require some very large,
but movable arrays. The Sterba Curtain is the optimum antenna for this task, but due to it's size, it's not very portable. Certainly won't fit on a Taurus Station Wagon without some sort of outrigging... and there is the ever-present problem with trees.

However, luck is with you, since most universities usually have (or have access to) this type of equipment in their electrical engineering department. Ask around, and don't be discouraged by being sent from department-to-department. Most university professors (especially the most senior ones, since they are the only ones likely to have the necessary Bi-Phase Multicomplicator experience necessary for this task) are usually only too happy to help out in this endevour.

Good Luck- Mark

I don't have the ability to do it (no way to receive shuttle audio except for via shortwave).

Realistically, if I could do it I would, but if I could do it, I probably wouldn't be asking someone else to..

SB SPACE @ ARL $ARLS013
ARLS013 German ham arrives at Mir

ZCZC AS92
QST de W1AW
Space Bulletin 013 ARLS013
From ARRL Headquarters
Newington, CT September 12, 1995
To all radio amateurs

SB SPACE ARL ARLS013
ARLS013 German ham arrives at Mir

German cosmonaut Thomas Reiter, DF4TR, has arrived at the Russian space station Mir. He will stay there for 135 days and operate DP0MIR, as time permits. Presently there are two crews aboard Mir, both very busy with scientific experiments.

One of the crews will return to earth in a few days, and Reiter is expected to have more time for Amateur Radio thereafter.

Listen for DP0MIR on 145.800 MHz for instructions for where to transmit.

Reiter expects to install 70 cm equipment capable of FM voice and 9600 baud packet modes sometime during his stay.

Thomas Kieselbach, DL2MDE, and Joerg Hahn, DL3LUM, of the Ham Radio Group of DLR (which is the German Mission Control for EUROMIR 95) said that there also will be picture transmission from Mir by means of a new SSTV mode. This new mode will transmit pictures, taken by a still video camera aboard MIR, in AX.25 packets. The protocol of this mode does not generate ''line by line'' pictures, but uses ''random'' sampling, making it possible to have an idea of the picture received after a short time, with the resolution improving as the transmission continues.

This information came from Norbert Norrhoff, DF5DP, the Deutscher Amateur Radio Club satellite and space projects coordinator.

What kind of antanna array do you intend to use? Most beams for OSCAR work have beamwidths >20 degrees, so it shouldn't be a great problem.

If you need something special, contact M2 Engineering in Fresno, Ca... in addition to antennas, they make some industrial strength Az-El mounts.

The story is oft repeated, but completley fabricated.
Several very excellent books have been published recently which document the Cosmonaut program with intensity. All the Cosmonauts who made the grade, so to speak, are accounted for, and their fates fairly well documented. Several female Cosmonaut candidates were chosen for early flights, but with the exception of Valentina Tereshkova, none flew until the mid-80's, all having trained, but having been dismissed from the corps.
You might care to redirect this question to the group sci.space shuttle, which fields these kinds of questions regularly.
May I also suggest that you pick up two books: "Uncovering Soviet Disasters", by James Oberg, and "A History of Cosmonautics". THe latter book is advertised in several of the space magazines that are out on the news stands.

Hi Folks..

Curious. Has anyone come up with a viable alternative for the
Yaesu az-el rotors ? I took a look at the specs, and was not
particularly impressed with +- 4% resolution back from the pots.

I wouldn't be a big problem to use a (TVRO-type) linear actuator
for elevation, but I have to admit the azimuth control has me
stumped for the moment.

Regards,
Jim Barber, N7CXI

>I haven't heard anything in several days of trying on 145.987.

Regretably no. The amateur payload was working perfectly, but the parent satellite, a Russian engineering spacecraft ended its lifetime and the Russians chose to shut it off instead of providing additional funding.

The disadvantage of piggybacking an amateur payload with another spacecraft is we're restricted by the parent's operation. If it's shut off - too bad for us.

Are you an AMSAT member? There was an excellent article in the Journal a bit back, along with up-to-date info on all of the operational OSCARs.

>Curious. Has anyone come up with a viable alternative for the
>Yaesu az-el rotors ? I took a look at the specs, and was not
>particularly impressed with +- 4% resolution back from the pots.

Unless you are using a pretty large dish, the resolution will not have any readable effect. The beamwidth of even the large KLMs is far greater than the reslotion.

>I wouldn't be a big problem to use a (TVRO-type) linear actuator
>for elevation,

I am using just this for a 6 foot dish at present, but due to the geometry the position readout does not match the dish. The linear actuator is in a straight line, while the edge of the dish turns in an arc so there would need to be a pot just like the Yaesu.

>but I have to admit the azimuth control has me
>stumped for the moment.

I have used a G-1000SDX with very good success. The dial is far better to look at, and the rotor is of much heavier duty construction. The pot reads to better than the 2 degrees I need for good pointing on 2400 mHz, but just barely.

This rotor can also be interfaced to a computer controller, such as a Sat Track IV or Kansas City Tracker, although Yaesu doesn't specifically say so. See my web page for a description of how to do it...

http://www.teleport.com/~n7ryw/asatpage.html

Lots of other good stuff there too.

1965. Preamps

Newsgroup: rec.radio.amateur.space
Date: 1995-09-12 00:00:00 UTC
From: rod@border.com
Message-ID: <DEt8GE.t7@janus.border.com>
Source record: 24076

Help wanted - info on supply of designs/kits/parts for GaAsFET preamps.

Frequency range, 10m - 70cm.

Primary usage, amateur satellite reception (currently struggling
with 10m downlink - S3 best sigs to date on a hor. loop at 15 feet).

From what I have read, I ought to be able to build these
with relatively little degradation in noise factor from the
commercial jobs - but a lot less $$ (??)

Email response preferred - my NEWS server erases postings
very quickly.

Thanks, Rod Adkins, VE3INE

I agree. It's a lot cheaper to ship the transmitter than for me to ship all
of my equipment around. Make sure all of the contacts are good and clean
prior to shipment. Don't ship the power supply or waste disposal system,
either, or I will need to charge extra for the cleanup.

If it's a ham related CD (you deleted the message so I can't tell) then I wouldn't call it spam. Besides rec.radio.swap is usally empty, so I doubt anybody reads it. (BTW I wish there was a real for-sale group, maybe even with the packet ads echoed to it.) The swapping seems to go on in .equipment. Lighten up a bit, and be thankful that the FCC hasn't regulated most commerce out of the picture here as on packet. This is a free country - let's keep it that way.

WEFAX Downconverter For Sale
Microcomm Model RX-1691, microstripline design
4" x 8" x 2.5"
Ampilifies and filters incoming 1.7 GHz satellite signal
before heterodyning to 137 MHz region.
Unit is about 10 years old but works perfectly, has been
unused for about 5 years since I moved into apartments!
Includes comprehensive manaul, circuit diagrams, etc.
Cost new was about $800, reasonable offer accepted.
Can fax detailed spec sheet.
Reply to tkreyche@well.com or call 206-726-9838.

1974. Looking for Novell trade!

Newsgroup: rec.radio.amateur.space
Date: 1995-09-13 00:00:00 UTC
From: darryl.linkow@ledge.com
Message-ID: <8B10231.01E9000A99.uuout@ledge.com>
Source record: 24082

Hello all and thanks for reading this. A couple of weeks ago I was negotiating a trade for an Icom 2 Meter All-Mode rig. The person who had the rig was interested in the Novell NetWare 4.02 that I have in trade for his radio and we are amidst negotiating when I didn't hear back from him. If you are that person, please Email me and let's put together a trade.
Regards,
Darryl Linkow KE6IHA

1975. Is STS-69 SAREX??

Newsgroup: rec.radio.amateur.space
Date: 1995-09-13 00:00:00 UTC
From: n5zgt@swcp.com
Message-ID: <437nk8$lm4@sloth.swcp.com>
Source record: 24083

Hello,
I was just wondering if STS-69 is a SAREX mission. Also, has anybody
heard it if it is?
Thanks!
PSE E-Mail me at n5zgt@swcp.com
73,
Brian, N5ZGT...

1976. QSL Address Dr. Norm Thaggart

Newsgroup: rec.radio.amateur.space

I agree. On the other hand, replying in *10* newsgroups to a post on 4 does
strike me as spamming.

1980. NORAD Two-Line Orbital Element Set: Space Shuttle (95256.41610185)

Newsgroup: rec.radio.amateur.space
Date: 1995-09-14 00:00:00 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.811055663@dolphin>
Source record: 24088

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (334) 409-9280, and are updated daily (when possible). Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current elements for the current shuttle mission are provided below. The Celestial BBS may be accessed 24 hours/day at speeds up to 28,800 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily), shuttle elements, and some documentation and software are also available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

AMSAT's Quicktrak is available for MS DOS, Commodore 64, and Apple II.

The Apple II version retails for $35, and members get a $10 discount.

Contact AMSAT at:
850 Sligo Ave. #600
Silver Spring, MD 20910
(301)-589-6062

Talk to Martha and tell her that Phil sent you.

One tip: NORAD 2lmes epoch occurs exactly at nothbound
equatorial crossing times. So at the epoch you have an exact
latitude of zero degrees. If not you have funny sw. Remember if
you use NORAd 2lmes you should be using an algorithm based on
NORAD's SGP4; otherwise errors are ensured. Most of the stuff I
have seen that is "free" uses SGP not SGP4. But I haven't tried
everything. Get a copy of NORAD's <Project Spacetrack> for
details. Buena Suerte!

1987. radio meteors--my antenna is....

Newsgroup: rec.radio.amateur.space
Date: 1995-09-15 00:00:00 UTC
From: andromed@Rain.cs.dal.ca
Message-ID: <DEyprL.52F@cs.dal.ca>
Source record: 24095

Hello;

I have yet to hear a radio meteor, the antenna I bought from
Radio Shack is a VHF/UHF/FM type BUT I have no place to mount it
outside and its on a tripod in my room.
Our house has no aluminum siding, and there are 2 outlets in my room,
the house is about 100 yrs old but we have fixed it up.
will the antenna be usable inside (radio Shack calls it an inside/outside
one).
Also, since I am not having much luck would a Ham receiver be senstive
enough to do this work ? There is a possibility I could get a used analog
one at the end of the month, if the person retiring sells it.

thank you in advance...

Mike

PS: I've read and re-read that FAQ on meteors...now I know how the
guys at SETI feel, searching for that alien signal..hell they
probally would get one before I get a meteor signal !!

> KE6CTH

From what I know (not much). MIR & SAREX are FM. In fact I
hear MIR last Sunday on 145.55 Simplex Voice. More commonly though
they use packet on SAREX & MIR. AO-27 is an FM bird on the weekends.
It's downlink is 436.80, Uplink on 145.85.

They're putting together a 70cm repeater on the MIR right now.
Downlink freqs. will be 437,925, 437.950, and 437.975. They will also
be working an 23cm TV stuff.

A0-27 isn't all that strong. I once heard it on my handheld. I've
even heard of people working it with a handheld. It's plenty sensative
to incoming signals. Just not to strong on the output.

Because of FM's constant carrier, it tend to use up too much power.
With the power budgets on satelites, you probably won't see much in the
way of FM in the future either. Packet, SSB, CW are the popular modes.

I don't even think Phase 3D is going to have FM. it'll have a lot
more capabilities though. With 2m, 70cm, and the microwave bands it'll
be interesting to see what it evolves into.

That's about all I can contribute. . .
Please correct me if I'm wrong on anything.

Buster

This message describes the rec.radio.amateur.*, rec.radio.cb,
rec.radio.info, and rec.radio.swap newsgroups, as well as their Internet
mailing list counterparts and complements. It is intended to serve as a
guide for the new reader on what to find where. Questions and comments may
be directed to the author, Jay Maynard, K5ZC, by Internet electronic mail at
jmaynard@admin5.hsc.uth.tmc.edu. This message was last changed on 31 October
1994 to add the discussion of non-Usenet mailing lists and streamline most
of the history discussion, and to change the moderator information for
rec.radio.info.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list
for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions
were held on the mailing list, and sent to the mailboxes of those who had
signed up for it. When the Usenet software was created, and net news as we
now know it was developed, a newsgroup was created for hams: net.ham-radio.
The mailing list and the newsgroup were gatewayed together, eventually.

Over the years, as the net grew, the volume of discussion became
progressively higher. First one by one, and then as part of two
reorganizations, what was once one group became many. In the process,
developments elsewhere on the net were reflected in the groups as they were
created, most notably the change to place all of the ham radio groups in one
hierarchy.

The collection of newsgroups continues to grow as more people join the net,
and as more topics of discussion gain volume, I expect to see more groups be
created as well. This follows what is happening on the rest of the net.

Nearly all of the radio newsgroups have corresponding mailing lists, the
notable exception being rec.radio.swap. There are also a few mailing lists
that don't have newsgroups.

The Current Groups
==================

It's important to post messages to the group that's appropriate for them,
and not to the groups that aren't. The whole idea of having different
```

newsgroups is so that folks who aren't interested in, say, homebrewing, don't have to wade through messages about homebrewing on the way to read about Field Day. Posting appropriately is just good etiquette.

The rec.radio.amateur.misc group is the catchall. It is what rec.ham-radio was renamed to during the first major reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, was removed on September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there. To answer a frequently asked question: No, there is no mailing list that goes along with this group. If you can't read Usenet news directly, you're out of luck.

The group rec.radio.amateur.policy was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate - it's now legal to order a pizza on the autopatch, if you're not in the pizza business - as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The group rec.radio.cb is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently David Dodell, WB7TPY. The email address for submissions to the group is rec-radio-info@stat.com. Inquires and other administrivia should be directed to rec-radio-info-request@stat.com. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups rec.radio.amateur.antenna, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

Mailing Lists

In addition to the mailing lists that mirror the Usenet newsgroups, there also are a few that stand alone. These cover specific areas of ham radio, and discussion is focused on just those areas.

The cq-contest mailing list is for discussions of contesting in ham radio. To join, send email with the word "subscribe" on a line by itself to cq-contest-request@tgv.com.

The DX mailing list covers the finer points of DXing. This one is also joined by mailing "subscribe" on a line by itself, this time to

dx-request@unbc.edu.

There's also a VHF mailing list, for VHF operators of the weak signal persuasion. You can join this one be sending "subscribe vhf" on a line by itself to vhf-request@w6yx.stanford.edu.

All of the following mailing lists are sponsored to the Boston Amateur Radio Club, as well as some others of local interest. Thanks to N1IST for the information.

qrp-l: This is the qrp mailing list, previously maintained by Bruce Walker at Think.com. It is for discussions about the design, construction, and use of qrp (low power) radios and related equipment.
arrl-ve-list: This is a one-way list, run by Bart Jahnke of the ARRL VEC, for announcements to VEs and VE teams.
w1aw-list: ARRL bulletins, news, and information
newsline-list: Redistribution of Amateur Radio Newsline
letter-list: Redistribution of the ARRL Letter
fox-list: Fox hunting and Radio Direction Finding
fieldorg-l: ARRL field organization discussions
ham-tech: Technical discussions and questions about Amateur Radio
arrl-exam-list: amateur radio license examinations scheduled in the US and in some foreign areas.

To sign up or inquire about these lists, send mail to listserv@netcom.com with the following in the body (subject is ignored) of the message.
<listname> is the name of the list to subscribe to.
To subscribe: subscribe <listname>
To unsubscribe: unsubscribe <listname>
For more information: help
To post (to the two-way lists), send your message to <listname>@netcom.com

Please do NOT send subscription requests to the mailing lists themselves; that doesn't work very often, and is very annoying to those on the list. Also, please keep your electronic mail address current with any mailing lists you subscribe to, as dealing with returned email is a nuisance for the person maintaining the mailing list.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while

still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

1994. NORAD Two-Line Orbital Element Set: Space Shuttle (95258.25042824)

Newsgroup: rec.radio.amateur.space
Date: 1995-09-16 00:00:00 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.811295062@dolphin>
Source record: 24102

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (334) 409-9280, and are updated daily (when possible). Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current elements for the current shuttle mission are provided below. The Celestial BBS may be accessed 24 hours/day at speeds up to 28,800 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily), shuttle elements, and some documentation and software are also available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

Does anyone have a source for replacement of the KLM 22c relays. Mine seem to have gone bad, and I've tried the cleaning tricks with no avail. I suppose I could go through KLM, but wondered if anyone out there has had to replace and found other makers of either the relays or the complete L/R switch modules.

Steve

I just put in an order for the Guardian relay this past week at work . I will look up the part number and tell you what it cost me. I had one go bad also so I thought I had better order some spares. Leo Schaaf

1999. AO-10 & 13 Signal Levels

Newsgroup: rec.radio.amateur.space
Date: 1995-09-18 00:00:00 UTC
From: jbuckham@ix.netcom.com
Message-ID: <43j017$26m@ixnews7.ix.netcom.com>
Source record: 24107

I need to compare some notes. I have just pulled my satellite station together, and this is what I have:

A KLM 2M-14C Downlink antenna.
A KLM 435-18C Uplink antenna w/CS-2 relay box
A Landwehr mast mounted preamp.
An RF Concepts 4-310 70cm 100w power amp.
Kenpro GB-500 Elevation Rotor.
Old Alliance HD-73 Azimuth rotor.
40' of RG-214 on uplink & downlink (2.5 dB of loss at 70CM, .9dB on 2M)
An ICOM 820H Radio.

Sounds like it should be up to the task? Right?

What kind of typical receive level should I see from AO-10 and 13 when the bird is, say, 20,000 miles out? I can receive the beacon quite well, and likewise on a loop test my signal comes in slightly under the beacon level and sounds clear- (beacon is about S-3 on my meter, my signal slightly under that reading.) I have been able to make contacts, however some stations are way "down in the mud" - and other receive stations are reasonably close (a few hundred miles) to me seem to be receiving them pretty well.

Since Oscar shares a reasonably low power, (35 watts?) for all users, is this a "normal" signal level for a setup of this type? Or is something wrong? Maybe I should I stack one more receiving antenna in the array? Right now, surprisingly the signal from AO-10 is much better than AO-13, I presume because of the attitude AO-13 is in for the next few months?

Anyhow, if you have any light to shine on my observations or suggestions please let me know.

John - KE6PID

2001. Satellite Antenna Questions

Newsgroup: rec.radio.amateur.space
Date: 1995-09-19 00:00:00 UTC
From: kory@avatar.com
Message-ID: <43n6hq$sp8@avatar.avatar.com>

Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.space

Hi everyone,

I`m trying to put together a sat station. I can't afford a al/ez rotor, so I'm researching into what fixed antennas I can build myself. I've narrowed it down to two types: an eggbeater or a TR array (turnstile-reflector). I know I can't work AO-10 or A0-13 with either of these antennas, but I expect to be able to work the LEO birds.

This brings up a bunch of questions that I hope some of you sat/antenna gurus can help me with:

1. Which one would you choose and why?

2. Both antennas require phasing (delay lines). To calculate the length of the coax, you need to know the velocity factor for that particular coax. How does one figure that out? Do I need to call the manufacturer of the coax for this?

3. I would like to add radials for the eggbeaters to increase the gain slightly. How long to the radials need to be? Can I just use a reflector like the TR array? If so, what is the best distance between the eggbeaters and the mesh? How about the eggbeaters and the radials?

Any help would be greatly appreciated.

Thanks,
Kory

Message-ID: <43nbrh$4ur@clarknet.clark.net>
Source record: 24111

I hate letter bands! Especially when radar and comm guys get togther
and mean something a bit different. Anyway, to the point.

What is the uplink and downlink for the Ku band SATCOM ?

Also, they guy asking may be saying generic Sattelite-communications and
not be addressing the specific SATCOM bird.

Is there a commercial satellite newsgroup?

2005. Re: KLM antenna relays

Newsgroup: rec.radio.amateur.space
Date: 1995-09-19 00:00:00 UTC
From: zardoz@ornews.intel.com
Message-ID: <43nhup$le@ornews.intel.com>
Source record: 24113

I have a KLM 2M-14C that I bought at a swap meet for $40. The relay was
bad and I fixed it but I found that I didn't seem to need Left Hand
circular much so the next time the relay gave me trouble I removed it as
well as the corroded circuit board and wired it up permanently for RHC.
Yes, the wires on the phasing harness do break easy and I had to repair
a broken center conductor on one of them. If you insist on using the
relay, KLM wants about $35 for a new relay with phasing harness.
KLM Antenna is 206-794-2923. An old ARRL article mentions installing
a Tupperware box over the relay to somewhat weatherproof it.

My 2M-14C model indicates big sidelobes and real testing shows me that
the model may be conservative. An old article in the AMSAT magazine described
adding 4 more elements (2X2) which would make it a 2M-18C. I modeled this
and it indicates 1.5db more gain. Might be worth it anyway but the sidelobes
remain large.

Sorry to dispute you, but your freqs are just backward, 14 up 11/12 down
with the difference freq being 2300 Mhz.
Also, there are different Freq ranges, but usually for the Domsats, the above
holds true.

There is a Navy MARS station active there. He has a good signal into the
midwest. I don't know if there are any amateur stations up and running
or not.

2010. NORAD Two-Line Orbital Element Sets (TLE680)

Newsgroup: rec.radio.amateur.space
Date: 1995-09-22 00:00:00 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.811809325@dolphin>
Source record: 24018

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (334) 409-9280, and are updated daily (when possible). Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at speeds up to 28,800 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily) and some documentation and software are available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space.news and rec.radio.amateur.space. This week's elements are provided below.

It's hard to say anything about S meter readings. With the setup
you describe, the beacon should be 12 to 15 db above your noise
floor (whatever S reading that is). That's not bad, but a KLM-22C
will improve it rather remarkably. The 14C isn't that good, better
than Cushcraft of course, but that's mild praise.

One acid test. Can you hear spin modulation on the transponder
noise floor? If you can't, then you need to improve your setup.
If you can, there's little point in going further.

Gary

FOR IMMEDIATE RELEASE
Number 95-03
September 22, 1995

NATIONAL AMATEUR SATELLITE SYMPOSIUM MEETING IN FLORIDA

Orlando, Florida - AMSAT, the Radio Amateur Satellite Corporation, will hold its thirteenth annual Space Symposium in Orlando Florida from October 6th to 8th, 1995. The meeting will be held at the Holiday Inn, located on SR-436 next to Orlando International Airport.

Some of the Symposium's highlights include:
! Steven Bible, N7HPR, will explain his innovative development of a World Wide Web Ground Station that monitors digital satellites.
! David Liberman, XE1TU, will describe UNAMSAT (Mexico) future activities.
! Bruce Paige, KK5DO, will discuss the Houston AMSAT Net re-transmission by commercial satellites.
! Peter Vekinis, KC1QF/EI4GV/SV4GV, will provide some interesting commentary on Picosats.

The Phase 3-D project was started by German amateur radio operator Dr. Karl Meinzer, DJ4ZC, who serves as the Project Leader for the international effort. Some of the participating countries include Germany, the United States, United Kingdom, Japan, Finland, Slovenia, the Czech Republic, Belgium, Hungary, Russia, and South Africa. Phase 3-D is the largest and most sophisticated spacecraft ever built for amateur radio operators.

AMSAT was incorporated as a non-profit organization in 1969 for the purpose of developing communications satellites for amateur radio operators. To date thirty one amateur radio satellites have been launched and fourteen are operational, in use by worldwide amateur radio operators.

Phase 3-D is scheduled for launch in mid-1996 on the second flight of the European Space Agency's Ariane 5 launch vehicle.

Information on Phase 3-D and other AMSAT activities is available on
Internet at AMSAT's WorldWideWeb site: http://www.amsat.org/amsat

2013. What freq of Ku band (SATCOM?)

Newsgroup: rec.radio.amateur.space
Date: 1995-09-22 00:00:00 UTC
From: pve@dg13.cec.BE
Message-ID: <30626571@smtp>
Source record: 24021

Worldwide there are various frequency bands for KU.

Uplink are always around 14GHZ, downlinks are always 11GHz.

The Ku band is split in the following(at least in Europe):

10950-11750 Called the FSS band. Split in H/V channels, normally
16GHz channels. Intelsat birds (except K) use
10950-11200 and 11400-11700 while Eutelsat birds use
10950-11200 and 11500-11700. Intelsat K uses
11400-11750 and 12100-12300.
11750-12100 Ku High band.
12100-12700 Telecom band for Telecom Satellites (French). Also US
Ku satellites
10700-10950 Ku Low band.

Most LNBs have switchable oscillators to handle the spectrum of frequency. A
22KHz tone runs dosn the LNB cable and switches high or low. Satellite
receivers have the ability to tune from 10700 - 12700 continuous.

2015. How best to filter ripple DC?

Newsgroup: rec.radio.amateur.space
Date: 1995-09-23 00:00:00 UTC
From: fx514@cleveland.Freenet.Edu
Message-ID: <43vloj$4n2@usenet.INS.CWRU.Edu>
Source record: 24023

Hello,

I'm using a 12 VDC converter intended for RV use. It charges a
battery when mains power is present, draws off it otherwise.

The output is unfiltered (ripple) DC and introduces unacceptable
noise into my packet gear.

What would be the best way to filter this? Just a big capacitor
across the output?

Thanks in advance for favours anticipated.

My name is Scott Glasrud, and I am running for the New Mexico State Senate during the 1996 elections. One of the reasons I have chosen to run is to combat the proposed state and federal regulations of the Internet. As you know, the Internet was never designed to be regulated! It was designed to allow communications in the event of anuclear war or a major catastrophe. I OPPOSE REGULATION, and if elected will fight to preserve your constitutional rights. HOWEVER, I NEED YOUR HELP!

I am asking each person who reeives this message to send $5.00 to the Scott Glasrud Campaign Committee. If we pull together, we CAN protect our first amendment rights! HELP ME show the politicians the POWER behind this important NETWORK. Please send contributions to:

The Scott Glasrud Campaign Committee
11024 Montgomery Blvd. NE, Suite 179
Albuquerque, New Mexico 87111

Thank you!

Unfortunately, transmissions of this type can be traced only for purely verbal thoughts. While it may be your subjective impression that most of your thoughts are verbal, it is likely that you actually have many thoughts in the forms of visual images. If you have studied math or computer programming, you may occasionally think directly in abstractions. (Doesn't sound like this will be a problem.)

Verbal thoughts are sent out on a bandwidth-hogging AM signal, usually at around 8.015 to 8.017 kHz. As you can see from sampling considerations, the audio quality is rather wretched. Another problem is that the signal is extremely weak, usually only a couple of nanovolts per meter even at the surface of the skull.

Fortunately, however, the low bandwidth of the carrier admits a rather elegant solution. Find a few square feet of sheet copper and build a hat like the Tin Person's head in "The Magic-Enabled Person of Oz". It should cover as much of your head as possible, being cylindrical up to the hairline, and conical from there up, ending in a vertical tube about 1/4" inch diameter. The purpose of this hat is to provide internal reflections that increase the intensity of your thought transmissions. Remember, the reflector must be as smooth as possible; no holes for eyes, nose, or mouth. The reflection properties will be improved if you can learn to hold some metallic object in your throat just above your Adam's apple; even a Brillo pad would be better than nothing.

The hat may have a subtle psychological effect on your thinking, and of course you would want to minimize that to get a clear signal. This can be done by wearing the hat continuously for several days. Do not be afraid to wear it in public places; you'll want to overcome any and all psychological reservations about the hat, including its social impact.

When the acclimation period is finished, you should find that at the end of the tube, you can pick up a signal of 20 or 30 nanovolts per meter. Because of the low frequency involved, you'll need to build a receiving antenna that will fit handily in the local high school's football field. The shape of the antenna doesn't matter too much, but the surface should be covered with alternating layers of copper, zinc, and chrome, each about 0.002" thick, to a full thickness of about 3". Other than that, the

only rule of thumb is to fill the field with as much metal as possible. You may need the school principal's permission.

If you are still unable to receive clear verbal thoughts, this may be due to a shortage of neural electrolytes. Several sports drinks like Gatorade claim to replenish electrolytes, and that may work fine for muscle electrolytes, but neural electrolytes are entirely another matter. What you want here is jalapeno peppers, eaten rapidly in liberal amounts, and washed down with one part Jolt Cola to three parts tequila. You may add salt and lime for taste. Plan on about 15 small jalapenos and one to two pints of tequila for each 20 minute transmission.

You may be tempted to reduce the acidity of the jalapenos by drinking water or milk, or eating sour cream, but don't do it! Any of those will immediately neutralize the electrolytes, and will not only ruin your experiment, but place you at risk for a brain siezure. Should this occur, your brain could only be restarted with one of those cardiac convulsion-inducer gadgets that they always use on those "real emergency" TV shows with the bad camera work. Paramedics should immediately remove your hat and apply the paddles to your ears. You may keep emergency personnel constantly apprised of the state of your brain by counting backwards loudly in Spanish during your experiment. But practice doing this beforehand until it becomes second nature, so it doesn't affect your transmitted thoughts.

Well, I think that covers everything. It's been a couple of years since I did this, and my notes are fuzzy in places, but that should get you started. When you're ready to tackle non-verbal thoughts, post another note and we'll discuss obscure demodulation techniques.

Dave, be sure and take your load directly from the battery. Then remote you charging supply WITH and large capacitor on that supply and connect to the batter through a small inductance. Even a few microhenries will do wonders to limite the hash generated by the charger. Cliff W6HDO

2021. What has happened to RS12?

Newsgroup: rec.radio.amateur.space
Date: 1995-09-25 00:00:00 UTC
From: kd9xc@execpc.com
Message-ID: <4472te$enl@homer.alpha.net>
Source record: 24029

Has RS12 gone off the air? I have not heard it since August 28, 1995.
Any input will be appreciated.

2027. Is AO-13 Mode-S working?

Newsgroup: rec.radio.amateur.space
Date: 1995-09-27 00:00:00 UTC
From: Douglas Braun <dbraun@hol.gr>
Message-ID: <44cgl4$vv0@newsflash.hol.gr>
Source record: 24035

I built a DEM S-band receiver converter (w/ preamp) and a helical antenna a couple of weeks ago, and I eagerly pointed it at AO-13 at the appropriate time, and heard absolutely nothing. I'm sure that is works OK and has reasonable gain, since I can hear the difference between ground and sky noise, and I can also receive the UO-11 S-band beacon. But I don't hear even the tiniest peep from AO-13!

Thanks,

Doug Braun (SV/N1OWU)

P.S.: If you want any advice or tips building the DEM stuff, let me know.

Hi,

A 1000 uF cap and an inductor should do the trick. You can find a suitable
inductor in a scrap PSU from a computer or other similar PSU. Connect as
follows;

```
Vin *--------///////-------------* Vout
| Inductor
|
-----
----- Cap 1000uf
|
|
*----------------------------* -ve
```

Gluck,
-Niko.

2033. 2m "Turnstile" Antenna for MIR (etc.)

Newsgroup: rec.radio.amateur.space
Date: 1995-09-29 00:00:00 UTC
From: rhebel@earth.execpc.COM
Message-ID: <199509292117.QAA17171@earth.execpc.com>
Source record: 24041

I built the 2m "turnstile" antenna shown in the VHF section of the latest ARRL Antenna Handbook. Near as I can tell, I built it correctly! I'm curious if anyone else has built this, or had experience with similar antennas.

Specifically, how do you tune the thing? Phasing link and all? Also, how critical is it for both dipoles to be in exactly the same plane? And if this is critical, how do you handle the connections to, and spacing between, the centerfed elements, which seem to create a kind of traffic "jam"?

My main use for this will be for space work, especially MIR.

Thanks for any help!

Keplerian bulletins are transmitted twice weekly from W1AW.
The next scheduled transmission of these data will be Tuesday,
October 3, 1995, at 2230z on Baudot and AMTOR.

2035. NORAD Two-Line Orbital Element Set Format

Newsgroup: rec.radio.amateur.space
Date: 1995-09-30 00:00:00 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.812489209@dolphin>
Source record: 24043

As a service to the satellite user community, the following description of the NORAD two-line orbital element set format is uploaded to sci.space.news and rec.radio.amateur.space on a monthly basis. The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (334) 409-9280, and are updated daily (when possible). Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at speeds up to 28,800 bps using 8 data bits, 1 stop bit, no parity. In addition, element sets (updated daily) and some documentation and software are also available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

==========

Data for each satellite consists of three lines in the following format:

```
AAAAAAAAAAAAAAAAAAAAA
1 NNNNNU NNNNNAAA NNNNN.NNNNNNNN +.NNNNNNNN +NNNNN-N +NNNNN-N N NNNNN
2 NNNNN NNN.NNNN NNN.NNNN NNNNNNN NNN.NNNN NNN.NNNN NN.NNNNNNNNNNNNN
```

Line 0 is a twenty-two-character name (this change is being made to be consistent with the name length in the NORAD SATCAT).

Lines 1 and 2 are the standard Two-Line Orbital Element Set Format identical to that used by NORAD and NASA. The format description is:

Line 1
Column Description
01-01 Line Number of Element Data
03-07 Satellite Number
10-11 International Designator (Last two digits of launch year)
12-14 International Designator (Launch number of the year)
15-17 International Designator (Piece of launch)
19-20 Epoch Year (Last two digits of year)
21-32 Epoch (Julian Day and fractional portion of the day)
34-43 First Time Derivative of the Mean Motion
or Ballistic Coefficient (Depending on ephemeris type)
45-52 Second Time Derivative of Mean Motion (decimal point assumed;
blank if N/A)
54-61 BSTAR drag term if GP4 general perturbation theory was used.
Otherwise, radiation pressure coefficient. (Decimal point assumed)
63-63 Ephemeris type
65-68 Element number
69-69 Check Sum (Modulo 10)
(Letters, blanks, periods, plus signs = 0; minus signs = 1)

Line 2
Column Description
01-01 Line Number of Element Data
03-07 Satellite Number
09-16 Inclination [Degrees]
18-25 Right Ascension of the Ascending Node [Degrees]
27-33 Eccentricity (decimal point assumed)
35-42 Argument of Perigee [Degrees]
44-51 Mean Anomaly [Degrees]
53-63 Mean Motion [Revs per day]
64-68 Revolution number at epoch [Revs]
69-69 Check Sum (Modulo 10)

All other columns are blank or fixed.

Example:

NOAA 6

2036. NORAD Two-Line Orbital Element Sets (TLE684)

Newsgroup: rec.radio.amateur.space
Date: 1995-09-30 00:00:00 UTC
From: tkelso@afit.af.mil
Message-ID: <tkelso.812489364@dolphin>
Source record: 24044

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (334) 409-9280, and are updated daily (when possible). Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at speeds up to 28,800 bps using 8 data bits, 1 stop bit, no parity.

Element sets (also updated daily) and some documentation and software are available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space.news and rec.radio.amateur.space. This week's elements are provided below.

2037. Re: Is AO-13 Mode-S working?

Newsgroup: rec.radio.amateur.space
Date: 1995-09-30 00:00:00 UTC
From: bob@texas.net
Message-ID: <44kjgl$gso@empire.texas.net>
Source record: 24045

In article <44cglb$vv3@newsflash.hol.gr>, Douglas Braun <dbraun@hol.gr> says:
>
>I built a DEM S-band receiver converter (w/ preamp) and a helical antenna a
>couple of weeks ago, and I eagerly pointed it at AO-13 at the appropriate time,
>and heard absolutely nothing. I'm sure that is works OK and has reasonable
>gain, since I can hear the difference between ground and sky noise, and I
>can also receive the UO-11 S-band beacon. But I don't hear even the tiniest
>peep from AO-13!

Doug;
Not to despair. First, with the attitude pointing the S-band antenna into
open space and the already QRPPP sigs, you're gonna have a tough time finding
S-band from AO-13. Also, the S-band beacon only operates in the beacon-ONLY
phases--the beacon is off when the sat is in mode S. Drove me crazy trying
to find the beacon until somebody 'splained it to me...

2038. Re: 2m "Turnstile" Antenna for MIR (etc.)

Newsgroup: rec.radio.amateur.space
Date: 1995-09-30 00:00:00 UTC
From: Richard David Glueck <glue9600@spacelink.msfc.nasa.gov>
Message-ID: <Pine.SOL.3.91.950930205346.19150B-100000@spacelink>
Source record: 24046

Richard: I built the turnstile type antenna pictured in the Handbook,
only mine was modified by an engineer who designed his with two
different impedence lines of coax. The whisker radials are made of
spun up copper wire (to harden it), and they are level with each other.
I have used it to work MIR packet, but haven't used it for voice
transmissions. Apparently, it balloons the radiated signal up into the
sky, with minimal lateral beaming. I found that I could copy MIR much
more readily with this antenna.
Good luck with yours. ANd yes, packing all those wires into the head of
it is a real pain! I wound up sealing mine with a glue gun.

2039. Any DSP-2232 users out there???

Newsgroup: rec.radio.amateur.space
Date: 1995-10-01 00:00:00 UTC
From: willhelm@ix.netcom.com
Message-ID: <44mg5n$mao@ixnews3.ix.netcom.com>
Source record: 24047

I am contemplating the purchase of the AEA DSP-2232 multimode TNC. However, i wondered if there was any distinct advantage of the DSP circuitry over the lesser priced PK-900 which isnt DSP but is a fine controller in its own right. The 2232 is rather pricey and for the average ham (who doesnt necessarily plan to use 9600 baud and go through the birds) i think the 900 might be a better choice. the only thing i am thinking about is the DSP capability and its advantage over the analog filtering in the 900. If you have one of the 2232's please give me your opinions on its operation. I heard some scuttlebutt a couple of years ago among 2232 users that AEA had kind of put the research and development of this controller (and its new modes that were supposedly coming out) on the back burner. I assume that happened because not a great deal of these pricey units were sold. Any help on this would be appreciated also. Thanks in advance.....Bill in Las Vegas

I use a DSP-2232. My major use is 9600 PacSat and terrestrial packet, although I have used it in most of its modes. There are "rumors" that new development is underway, but I have heard nothing lately. It's a good machine but cost-effective only if you make good use of its many modes.

I wish AEA would truly open up the programming interfaces so independent development could take place.

2041. NOAA Polar Satelite Status

Newsgroup: rec.radio.amateur.space
Date: 1995-10-01 00:00:00 UTC
From: bsmando <bsmando@micron.net>
Message-ID: <44mod6$fe3@mis02.micron.net>
Source record: 24049

It seems like NOAA 9 is currently non-operational. I wonder if there is a source that someone could sugest which would give the current status of the NOAA polar satelites? I have tried NOAA WWW sources, but no luck.

Thanks in advence

Pat N7MPS

2042. Need Address Info for DG3GAQ

Newsgroup: rec.radio.amateur.space

From: headshrnkr@aol.com
Message-ID: <44n1eo$jrl@newsbf02.news.aol.com>
Source record: 24050

I seem to be unable to locate the correct address info for this callsign. I worked this gentleman on AO-13 on 10/1/95 and perhaps I copied his call incorrectly as I do not seem to be able to locate it in any database. If anyone has any ideas or suggestions please advise. His first name was Peter, and he was located in grid square JN48GE, or so I copied. Thank you.

Hi!

Is there anyone out there who can get a copy of the recently released version
of the American Sat tracking and display program to me? Unfortunately we in
Tassie are not overly well served by BBs's providing AMRAD specialisation.

I'm curious, did anyone have a QSO with the Doctor while he was
onboard the MIR and QSL with him? I had several QSO's with him but
didn't send him my QSL card as I have moved and everything is buried.
Also, can someone please post the address to send him a card?

Thanks and 73's

Problem is that they (DSPX232) are CLOSED systems, now take the
DSP93 from TAPR - wide open, write your own code or enjoy what
everyone else writes!

: Thanks in advence

: Pat N7MPS

Only APT satellites operating currently are NOAA 12,14 and METEOR 3-5.
NOAA9 and NOAA11, NOAA14 are DOA. NOAA14 had a shorted buss within a
couple months of operation and NOAA9 is now over 10 years old and well
exceeded it's design life.

* JOINT ESA/CNES PRESS RELEASE *
================================
Revised Ariane-5 launch timetable

Tests on the Ariane-5 launcher's cryogenic main stage have been under way
in Kourou for a year and were to have ended in the third quarter of 1995
with the subassembly's qualification. Many positive results were obtained
over the summer, but it was not possible to achieve some of the objectives
set for that period and a number of malfunctions disrupted the tests,
mainly as a result of problems encountered with operation of the ground
facilities. In addition, a leak in the oxygen feed line in the upper part
of the stage and a hydrogen leak at thrustframe level made it necessary to
improve the leak-tightness devices in a number of circuits. Lastly, an
incident on 01-September affecting the actuator system in the Vulcain
cryogenic engine led the board set up to analyze the problem to conclude
that the fault lay in the high-pressure oil distribution system, which
was subject to a water-hammer effect. Measures were immediately taken to
reinforce the circuit and repair work on the Vulcain engine was completed.

An overall verification test without a firing will be carried out early in
October to validate the changes made to the stage. It will also provide an
opportunity to check that the test systems are operating properly.

A detailed review of the time schedule has been carried out to take account
of the qualification objectives that have already been met and those that
remain for the launcher as a whole (systems, stages, subassemblies and

ground facilities).

All this work means that the start of the 501 campaign is now planned for early February 1996 with a view to the 501 flight taking place in late April and the 502 flight in September.

The European Space Agency has delegated the management of its Ariane-5 programme to CNES, the French space agency.

* SABLE ISLAND DXPEDITION *
==========
Wayne, VE1CBK; Ken VE1RU; Gary, VE1RGB and Don, VE1AOE will be active as CY0TP from Sable Island October 1 - 10, 1995, weather permitting. Sable Island is located at 60 degrees 2 minutes WEST Long., 43 degrees 56 minutes NORTH Lat with a Maidenhead Locator Square of FN93xw.

The equipment is already on Sable Island and the four operators will be departing Halifax, Nova Scotia by air at 13:00 UTC 30 Sept 1995. Don, VE1AOE will be the principle Satellite Operator and will be active on AO-10 and AO-13 along with most of the LEO analog satellites (including Mode K on RS-12/13.) Operation on the RS (and LEO) series of satellites will probably appear first followed by AO-10 and AO-13 later. Don expects to be very active on the satellites throughout the whole DXpedition period.

All 6-meter, VHF, UHF, satellite, and EME QSLs go to:

Don Roland, VE1AOE

* AMSAT-NA AT SHORE AREA HAMFEST '95 *
=====================================
The seventh annual Shore Area Hamfest will be held from 8:00 AM until
2:00 PM on Sunday 08-Oct-95 at Brookdale Community College in Lincroft,
New Jersey. Brookdale Community College is located in Monmouth County
on Newman Springs Road, about two miles west of Garden State Parkway
exit 109.

This year's Hamfest promises to be the BEST EVER and will feature an ARRL
NJ State Convention, technical seminars, computer and electronics vendors,
door prizes, VE testing sessions, and offer breakfast and lunch in the
College's cafeteria. A representive from AMSAT-NA will also be in
attendance to demonstrate the latest in satellite tracking software,
answer questions, and display a scale model of the Phase III-D satellite.

A World Wide Web page has been established for additional information on
the Shore Area Hamfest. Feel free to visit the page at the following URL:

http://www.njin.net/~magliaco/hamfest.html

I hope to see YOU at the Shore Area Hamfest '95!

HI.

I would like to use my old 8 bit computer to track stats,
i.e. C64 .
Or would anybody have a formula to convert the kepps or failing that
any way to track the stats with a simple program formula for a simple
program that could be written for AMSTRAD CPC464 ,TI9948.

Thanks alot
lez ei9ejb.

2051. Re: HELP with RS 12/13 please!

Newsgroup: rec.radio.amateur.space

Message-ID: <44q28p$hg4@usenet2.interramp.com>
Source record: 24059

Hi,

Well I can offer a little help. RS 12/13 transmits on the following:

Beacon: 29.408

Downlink: 29.410 / 29.420 / 29.430 / 29. 440 / 29.450

Robot: 29.454

You need to have your receiver in Single Side Band mode and listen for CW (morse code).

The tracking program I use is called TRAKSAT.

Thats about it. Hope this helps.

2052. Re: Is AO-13 Mode-S working?

Newsgroup: rec.radio.amateur.space
Date: 1995-10-03 00:00:00 UTC
From: sem2r@galen.med.Virginia.EDU
Message-ID: <DFvLzr.3u7@murdoch.acc.Virginia.EDU>
Source record: 24060

Dear Doug-
The Mode S works fine on AO-13, the problem is that until the satellite is repositioned at the end of October to its good orientation (ALON 180deg, ALAT 0deg), there is no "pure Mode-S" in the transponder schedule. Mode BS comes on late in the orbit schedule when the satellite is very low in the south. Mode BS is difficult to operate under even ideal circumstances. Are you listening at the proper time in the orbit schedule, not just when the satellite is above the horizon? Even more importantly, the very low power transponder 1.2 watts has a highly directional antenna. If the offpoint (squint) angle is more than about 8-10 deg, forget it, and less than 5 deg is best.

After October 31, at the proper time in the orbit (near apogee) with a low offpoint angle, you should have a lot more luck. I don't even try to hear Mode-S when the satellite is in its current attitude.

I hope this helps. Let me know if I can answer any othe questions. Mode-S is going to be great on P3D!!

Hi Leslie.....A very good tracking program is still available for the C64 Commodore computer. It is advertised on occasion in QST by Bob Dalleski, W6AMW at box 220, Mount Shasta, Calif. Good luck Cliff W6HDO
